PREFACE

WHILE the philosophy of the Vedānta is well known in Europe the Nyāya and Vaiśeṣika the Indian systems of logic and realism have attracted hardly a tithe of the interest due to them as able and earnest efforts to solve the problems of knowledge and being on the basis of reasoned argument. The systems are indeed orthodox and admit the authority of the sacred scriptures but they attack the problems of existence with human means and scripture serves for all practical purposes but to lend sanctity to results which are achieved not only without its aid but often in very dubious harmony with its tenets.

The neglect of these schools in Europe is abundantly explained by the nature of the original sources. The contempt of Indian science for the uninitiated has resulted in modes of expression unequalled for obscurity and difficulty, the original text books the Sūtras present endless enigmas which have not one feels assured yet been solved and which in most cases will never yield their secrets. The works of the Nūḍea school of Bengal in their details frequently defy explanation and in translation are more obscure if possible than their originals. Hence even historians of Indian philosophy like Professors F. Max Müller and P. Deussen have contented themselves with sketches which ignore entirely the serious and valuable thought of the schools. The result

is *gravely embarrassing* for any serious study of Indian philosophy as a whole and for this reason I have deemed it desirable to attempt to set out the fundamental doctrines of the systems with due regard to their history and their relations to Buddhist philosophy. The difficulty of the task is such that no absolutely certain results can be achieved the Sūtras are still presented in India in the light of centuries of development, and often with *palent disregard of the meaning of the text* even by competent philosophic students and the originals of many Buddhist works are lost and we are compelled to rely on Tibetan versions. But it is clearly an indispensable preliminary to further progress that some effort should be made to formulate the results attainable with the information now at our disposal.

Considerations of space have rendered it necessary to omit all mere philological discussion and all treatment of points of minor philosophic interest. On the same ground no effort has been made to trace the vicissitudes of either system in China or Japan or to deal with either Buddhist or Jain logic save where they come into immediate contact with the doctrines of the Nyāya and Vaiśeṣika.

I have given references to the original authorities for any statement of importance but I desire to express a more general debt to the works of Y. V. Athalye, S. C. Vidyabhusana, H. Jacobi, Ganganatha Jha, Th. de Stecherbatskoi and L. Sual. To my wife I am indebted for advice and criticism.

PART I

THE LITERATURE OF THE NYAYA
AND VAIṢEŚIKA

CHAPTER I

THE ORIGIN AND DEVELOPMENT OF THE
SYSTEMS1 *The Antecedents of Logic and the Atomic Theory*

INDIA incurious even of her varied and chequered political history has neglected even more signally the history of her philosophical achievements. Even in the period when discussions between the schools resulted in the production of sketches of the several systems such as those of Haribhadra and Madhva the expositions given attempt no historical treatment of the various systems, but treat them merely from the point of view of their relation to the favourite system of the author whether Jain or Vedānta. The earliest works of the Nyaya and Vaiṣeṣika present us with definitely formed schools which presuppose much previous discussion and growth but it is only occasionally that a later commentator like Vatsyayana assures us definitely that another school—doubtless an older one—gave the syllogism ten in place of the traditional five members,¹ or mentions so much divergence of opinion as in the case of the forms

¹ On NS : 1 32

of inference,¹ as to induce the belief that the variation of view did not merely arise after the production of the Sutra. We are reduced therefore to seek outside the schools in the Brahmanical Buddhist and Jain literature for hints of the origin of the logic and atomic theory of the Nyaya and the Vaiśeṣika.

On one point there can be no dispute, the Brahmanas and the Upanisads do not present us with anything which can be said to foreshadow these doctrines. The public controversy of the Upanisads may however be noted as a feature which favoured the growth of logic and sophistry, and apart from the great weight allowed to the Veda in general and the Upanisads in particular in the arguments of the two schools it may be pointed out that the doctrine of the place taken in perception by mind is foreshadowed in the Upanisads² whence also is derived in a revised form the Nyaya doctrine of sleep.³ In even the Dharma Sūtras which are the latest stratum of the true Vedic writings neither system finds mention and this is the more important in that Nyaya there occurs in its general sense of argument or conclusion and also in Apastamba⁴ in the specific sense of the principles of the Pūrva Mīmāṃsā school. In it we have the result of reasoning addressed to the determination of the conflicting declarations of Vedic texts regarding the order and mode of performance, the purpose and results of the sacrifice while many of the important sacrifices included in their course discussions by the priests on sacred topics (*brahmodya*)⁵. As astronomy geometry philology and other sciences arose in close connexion with the sacrificial ritual so we are entitled to regard the Nyaya as a development of a tendency which is seen in operation first in

the Mīmāṃsā school¹ But in the hands of the Pandits² who took it up logic was applied to a wider range of interests than the sacrifice, and developed for its own sake. Thus most easily is explained the fact that Nyāya which remains to the end a characteristic term of the Mīmāṃsā is the specific appellation of the Nyāya school, while the Buddhists retain it in the larger sense of inference

In the earlier grammatical literature Panini, Kātyāyana, and Patañjali know the meaning of Nyāya as conclusion, but show no trace of recognizing a Nyāya system³ The great epic however gives us positive evidence of such a system apart from other references,⁴ the sage Narada is described as skilled in Nyāya able to distinguish unity and plurality conjunction and inherence, priority and posteriority deciding matters by means of proof, and a judge of the merits and demerits of a five-membered proposition⁵ The mention of inherence shows plainly that the Vaiśeṣika is also recognized, though its name does not occur and sophistry is denounced in several passages But the mention of Nyāya here and in the Purāṇas⁶ is useless for purposes of dating, none of the references need be earlier than the appearance of the schools though the omission of Kanāda's name is worth noting The Smṛti of Yājñavalkya also which mentions Nyāya with Mīmāṃsā as a science,⁷ is not earlier than the third century A D

More interest attaches to the term Ānvikṣiki as a name

would account for its sharp opposition to the Vedic science, and that at an early period it was applied also to sacred things and fusing with the Nyaya developed from the Mimamsa produced the Nyaya as a logical school. This may account for the extent to which logic seems to have disengaged itself from the Mimamsa.

A final hint of the date of the schools is suggested by the fact that Caraka in his medical Samhita¹ gives a sketch of some of the Nyaya principles not without variation in detail and of the Vaiśeṣika categories in such a way as to indicate that he regarded the systems as supplementing each other. Unhappily however not only is Caraka's date uncertain but his work has suffered refashioning and the authenticity of the text cannot be admitted. Nor can any stress be laid on the variations from the Nyaya school² an unscientific exposition of this kind need reflect nothing more than the lack of knowledge of its author and sheds no light on the early history of the school.

The literature of Buddhism gives little aid. The Buddhist doctrine of perception in its developed form has affinity with the Nyaya but no derivation suggests itself either follows a line of thought already foreshadowed in the Upanisads³. The old Pali texts⁴ ignore the names Nyaya or Vaiśeṣika. In the *Brahmajālasutta* we hear in lieu of them only of *takkā* sophist and *vimāṇsī* casuist and in the *Udana* *takkikas* appear as in the epic and Puranas. The silence is of importance still more so the fact that in the *Katāvatthupparakana* which does not claim to a greater antiquity than Aśoka's alleged Council about 255 B.C., we find no reference to either school and nothing more significant than the use of the terms *patinna*

⁴ Vāṇyabī sīna *Med Log* pp 61ff

proposition *upanaya* 'application of a reason' and *niggaha* 'humiliation' which later in Gautama's logic are technical terms but which at this period have their more general sense. It is in keeping with this that the Nyaya under the name *Niti* and the Vaiṣeṣika first appear in the *Milindapañha* but unhappily the date of that text is wholly uncertain as in its present form the work represents an elaborated version of a simpler original and references of an incidental kind such as this could easily be added¹. Of more precision is the Buddhist tradition² which asserts that Vaiṣeṣika adherents were alive at the time of the Buddhist Council of Kaniska which may be placed at the end of the first century A.D. But here again we have no assurance of the value of this tradition for all regarding Kaniska's Council if it were held is fabulous and confused.

The Jain texts yield a little more. Their tradition preserved in a late text the *Ataṣṭyaka* in a possibly interpolated passage and in late prose versions attributes the Vaiṣeṣika system to a Jain schismatic 544 years after Vardhamana Rohagutta of the Chaulu family whence the system is styled Chaluga. The summary of principles given is clearly Vaiṣeṣika of the Kanada type nine substances seventeen qualities five forms of motion, particularity and inherence with however three forms of generality somewhat obscurely phrased. Here again however the date of the *Ataṣṭyaka* not to mention this passage is unknown but doubtless late and not the slightest faith can be put in the claim that the Vaiṣeṣika was an offshoot of Jainism nor is any useful purpose served by endeavouring to find in Chaluga a corruption of

Aulūkyā. What is of importance is the question whether in the Jain system there is evidence of anything which could give rise to the Nyāya or Vaiśeṣika systems. The Jain system¹, in its view of knowledge, takes the peculiar view that direct knowledge (*pratyakṣa*) is that which the soul acquires without external aid such as the senses, it takes the form of direct knowledge of things beyond our perception (*avadhi*) of the minds of others (*manah-pariyāya*), and complete knowledge (*kevala*). Under indirect knowledge (*parokṣa*) is included direct sense perception (*mati*) and that which is obtained by reasoning (*ṣrutī*). In the *Sīhanānaga Sūtra* we find mention made of the usual four means of proof perception inference comparison, and verbal testimony and there are given certain classes of inference, but in view of the uncertain date of this text it is idle to claim priority for the Jain logic, nor, as it appears in such authors as Umasvāti² and Siddhāsena Divākara,³ is there anything to suggest that logic was the original possession of the Jains. The more characteristic doctrine of knowledge⁴ of that school is summed up in the doctrines of indefiniteness (*syād-vāda*) and aspects (*naya*). To the Jains everything is indefinite and changing in point of quality, permanent only in respect of substance and thus to make any true statement about it demands a qualification of anything we can say, 'In a sense it is or is not, or is and is not or is inexpressible, or is or is not and is inexpressible, or both is and is not and is inexpressible'. Similarly the Nayas are modes of regarding reality from different points of view. In all this, which is of dubious date and still more dubious value, it would be vain to find a model for the Nyāya.

¹ Vidyābhūṣana *Med. Log.*, pp. 3 ff.

² *Tattvārthasūtra* *gama Sūtra*, before sixth century A. D., ZDMG ix. 288 ff.

³ *Aṅgikāra* c. 653 A. D.

⁴ H. L. Jhaveri, *First Principles of Jain Philosophy*, pp. 34 ff.

The case is different with the atomic theory for in this case we do find a definite similarity between the atoms of the Vaiśeṣika and those of the Jain. In the Jain conception¹ however the atom has taste colour smell two kinds of touch and is a cause of sound though soundless and thus differs from the Vaiśeṣika atom which has no connexion with sound and has one two three or four of the ordinary qualities according as it is air fire water or earth. The Jain atoms are thus qualitatively alike the Vaiśeṣika not. In both cases the atom is thus a relatively complex conception as remarked by Ćāṅkara in his refutation of the atomic theory² and it is by no means easy to say that the Vaiśeṣika conception must have been or even probably was derived from the Jain. The fact that the Jain school retained the theory without any substantial development is merely one of many proofs of the metaphysical barrenness of the school. Nor is it difficult apart from Jain influence to believe in the development of the doctrine in the school from the natural aim to find something abiding in the flux of phenomena which Buddhists asserted while the Aupanisada doctrine offered a permanent abiding reality in the absolute but only at the cost of denying the reality of the finite multitude. There was room therefore for a solution which would attain a reality not transcendental as in the case of the Upanisads but lying at the basis of the real though momentary or temporary phenomena of the world. That this was the line of reasoning which led to the acceptance of the atomic theory appears from the earnestness with which the *Ayuri Sutra* attacks the Buddhist doctrine that there was no substance behind the qualities no whole beside the parts. The

¹ J. L. Jain: *Outlines of Jainism* p. 90. SEF xlv 193 209 210

² On BS i 2 15

acceptance of such views led to the disappearance of all solidity in existence and the atomic theory makes good this lack by affording a real basis for the substance we see. When it is investigated it does not reduce itself as claimed by the Buddhists to its constituents or qualities but is ultimately a congeries of atoms which are real but in themselves imperceptible¹

There remains however, the possibility of Greek influence on India in the case of this doctrine. It must be admitted that it appears in India at a late date certainly no proof of it exists until India had been in contact with the Greek kingdom of Bactria and the Greek influences which came in with the occupation of territory on the north west by princes of Greek culture. In Greece the doctrine was not merely one of a small school the adoption of it by the Epicureans raised it into a widespread belief and it would be irrational to deny that it might easily have been conveyed to India just as Greek astronomy and astrology unquestionably were. The nature of such borrowings is often misunderstood, the mere adoption without alteration of an opinion would be wholly un-Indian though we know that Greek astronomy was borrowed we find it was recast in an entirely un-Greek fashion² and so changed and developed were Greek Mathematics that the borrowing has often been ignored³. It is no argument against borrowing then that the Greek doctrine that the secondary qualities were not inherent in the atoms was not accepted and that the motion of the atoms was

¹ On the general appearance of Jain doctrines as influenced by Vaiśeṣika views cf. Bhandarkar *Report for 1933-4* pp. 101 ff. A primitive view recognizing the self as well as the five elements appears in the *Sūtrakṛdāga* (SBE. XLV xxiv), but this is very far from the Vaiśeṣika. The age of Buddhist atomism (U. p. 16 ff.) is very dubious.

² Thibaut *Pancatantra* pp. ciii ff.

³ Kaye *Indian Mathematics*, pp. 8 ff.

ascribed as early as Pīṣaṣṭapada at least to a creator. On the other hand the most peculiar part of the Indian doctrine which finds that the smallest thing possessing magnitude must be made up of three double atoms and which has therefore been claimed¹ as disproving Greek origin is no original part of the system. The problem of origin therefore must remain open for borrowing the chief evidence apart from the obvious similarity of the doctrines in their conception of the unit atom and its imperceptibility is the sudden appearance of the dogma in Indian thought at a period when Greek art had profoundly influenced the art of India and India had long been in contact with the western world, in which the doctrine had passed into a common and popular as opposed to an esoteric doctrine.

Of logical doctrine in its early stages there is no reason whatever to suspect a Greek origin. The syllogism of Gautama and Kanada alike is obviously of natural growth but of stunted development. It is with Dignaga only that the full doctrine of invariable concomitance as the basis of inference in lieu of reasoning by analogy appears and it is not unreasonable to hazard the suggestion that in this case again Greek influence may have been at work. But the possibility of a natural development is not excluded only it must be remembered that perhaps two centuries before Dignaga Aryadeva one of the great figures of Mahayana Buddhism uses terms displaying knowledge of Greek astrology and that by A. D. 400 the probable date of Dignaga spiritual intercourse between east and west was obviously easy. Nor is it without interest to note that some evidence has been adduced of Aristotelian influence on the dramatic theory of India as preserved in the *Bharata Śāstra*.²

¹ Max Müller *Six Systems* p. 584

² M. Lindzenau, *Festschrift E. W. Schulz* pp. 38-40. On Greek influence on Indian thought cf. also Lévi *Manu et la culture hindoue* li. 17-18

substances, earth, water, fire, air, ether, space, and time, Book III treats of the objects of sense, and establishes the existence of the self and the mind, dealing also with the theory of inference, Book IV contains the atomic theory, and discusses the visibility of quality and the nature of body, Book V deals with motion, Book VI with the merit of receiving gifts and the duties of the four stages of life, Book VII mixes up quality, the atomic theory, the self, and inherence, Books VIII and IX are mainly concerned with perception and inference and Book X deals with causality, among other topics.

✓ Of the personalities of Gautama and Kanada we know absolutely nothing. The personal name of the former Aksapada has the appearance¹ of being a nickname such as early India seems to have loved, 'one whose eyes are directed at his feet', but it is variously interpreted² and embellished with idle legends. Kanada,³ alias Kanabhuj or Kanabhukṣa, denotes 'atom (of grain) eater', and would naturally be interpreted as a nickname due to his theory, Çridhara,⁴ however reports it as due to his habit of living on grains fallen on the road like a pigeon. To Praçastapāda we owe the knowledge that his gentile name was Kaçyapa, and that Çiva revealed in owl (*ulūka*) shape the system to him as a reward for austerity, whence the name *Anulūka* which the *Nyāya-vārttika*⁵ already applies to it. The worthless Purāṇa tradition proceeds to invent Aksapāda, Kanada and Ulūka as sons of Vyasa, while ingenuity, ancient and modern, has invented equally worthless identifications with the Gautama of the *Gautama Dharma Śāstra* and

¹ Garbe, *Bei rāga z. und A. it. gesch.* p. 32.

other members of that great clan, based on nothing more secure than the identity of the family name. In truth we are left entirely to internal evidence and the history of the texts to discover their date.

The first point which may be treated as certain is that both texts were known to Vātsyāyana who, as will be seen lived before Dignāga, probably in the second half of the fourth century A.D. He commented on the *Nyaya Sūtra*, and used the *Vaiśeṣika* categories he quotes aphorisms found in Kanada's Sutra¹ and appears to have recognized it as in some degree a kindred school. This fact renders specially difficult the second question which presents itself that of the priority of one or other of the two texts. It must be recognized at once that there is no possibility of treating the two systems as having grown up apart without mutual influence. In favour of the priority of Gautama's work some evidence can be adduced, the *Vaiśeṣika Sutra* marks in treating of inference a definite attempt to enumerate the real relations which afford the ground of and justify the inference while no attempt of this sort is made in Gautama again while the *Vaiśeṣika* doctrine of fallacies is different from and simpler than Gautama's. Kanāda uses without explanation the term *anāikāntika* "indeterminate" as the description of a fallacy while Gautama has it in a definition. Much more doubtful is a third piece of evidence, Gautama² in proving the self refers to mental phenomena alone as signs of its existence while the *Vaiśeṣika* mentions also the physical signs of expiration inspiration blinking the vital processes the movement of mind and the activities of the other sense

¹ *ibid* I 16 in Comm. on *VS* II 2 34 IV 1 6, 11 Comm. on III 1 33.

organs. The last case seems rather to indicate that the Vaiśeṣika is the older standing as it does on a less philosophical standpoint. This conclusion¹ is supported by the fact that Gautama deals carefully with other points which have less effective treatment in the Vaiśeṣika, such as the eternity of sound the nature of the self the process of inference and fallacies generally, and the reference to a *pratītantra siddhānta* must be understood—though curiously enough in his comment on this passage Vatsyayana illustrates the relation by the Sāṃkhya and Yoga—as an allusion to the Vaiśeṣika which Vatsyayana elsewhere accepts in this relation. Gautama² refers also to the question of the action of a creator (*īśvara*) though he leaves the main question unsolved. It is difficult therefore to evade the impression that Kanada is the older of the two and that the failure of the Nyāya to accept his classification of the grounds of inference was not due to its being a later product but to its being a part of the Vaiśeṣika system which the Nyāya rejected. The great improvement in the order of the *Nyāya Sūtra* is also symptomatic of a later date for the redaction of that system.

Further support for this view as well as some vague indication of the period of redaction of the Nyāya may be derived from the patent fact of the polemic carried on in the school against Buddhist doctrines. The most important point in this regard is whether the Buddhist views attacked are those of the nihilist Mādhyamika school or the idealist Yogācāra school the former of which is connected with the name of Nāgārjuna, who has been assigned to the third century A.D. as his contemporary. Aryadeva mentions the days of the week an

¹ The statement by (Gautama) is used in a much more full and more in the Vaiśeṣika. Deussen *Allgem. Gesch.* I. ii. 361-362.

² Is. i. 12-21.

innovation probably of that period while the latter seems to have been developed in the middle of the fourth century by Asanga and Vasubandhu¹ Gautama² clearly refers to the view of Nagārjuna and Aryadeva that the effect before production is neither existent non-existent or both, to the doctrine of the former that all things have no real existence possessing merely an illusory interdependence, to the assertion that a substance has no reality independent of its qualities nor the whole apart from its parts to the denial of the doctrine of atoms,³ and to the belief that means of proof and their objects are no more than a dream or a mirage as well as to less distinctive Buddhist doctrines as the momentary character of existence and the defilements (*kleṣa*) It is a much more doubtful theory that one passage of the Sutra is directed against the Yogācāra doctrine which accepted ideas alone as real for the contents on the whole better fit the Mādhyamikas and the most striking evidence⁴ in favour of the other view the parallelism between the wording of one aphorism and a passage in the *Lankavatara Sutra*, is not convincing because the Sutra in its present form is not earlier than the sixth century A.D. as it prophesies the Hun rule of that period⁵ and because the doctrine enunciated there can be interpreted equally well as a Mādhyamika principle namely that on investigation of any object no substance is found outside its parts or qualities.⁶

'ignorance', and *matyagātman*, 'individual self' is reminiscent of the *Brahma Sūtra*. Gautama is familiar with the terminology of the *Brahma Sūtra*,¹ and also with that of the *Mīmāṃsā*, which is probably not later than the *Brahma Sūtra*. But to claim that the *Nyāya* or *Vaiśeṣika* was redacted later than the other two *Sūtras* is wholly impracticable. It is more interesting to note that an early exponent of the *Mīmāṃsā* seems to have been familiar with the *Nyāya* terminology.² But his date is wholly uncertain, though the fact is important as a sign that the *Nyāya* early influenced very powerfully the *Mīmāṃsā*, and received stimulus from it in return.

3 *Prāṣastapāda, Vātsyāyana, and Uddyotakara*

The *Bhāṣya*³ of *Prāṣastapāda* is undoubtedly the most important work of the *Vaiśeṣika* school. It is no commentary in the strictest sense of the term, the aphorisms of Kaṇāda are not cited *in extenso* or by catchword as normal in commentaries, the order of the *Sūtra* is not followed, and careful research reveals at least forty aphorisms which have no place in the *Bhāṣya* apart from the additions which it makes to the doctrine. The arrangement of the material is that which is adopted

¹ Cf. NS. iii 2 14 16 with BS. ii 1 24, for *Mīmāṃsā* see NS. ii 1 61-7.

² Cf. *Çobarahāṣya*, p. 10, the *Vṛttikāra* is usually identified with *Upavarṇa*, but see JAOS. xxxi 17 where *Bodhāyana* is suggested. Keith, JRAS. 1916, p. 370. Arguments in favour of Gautama's date as the fourth century B.C. on the score of *Upavarṇa* being a contemporary of a Nanda need not seriously be refuted. Speculations (e.g. *Bhandarkar Comm. Vol.*, pp. 161 ff.; Deussen, *Allgem. Gesch.*, I iii 338) as to an original *Nyāya Sūtra* consisting of Book I, or less, lead to no definite result, but the suggestion that *Vātsyāyana* is responsible for remodelling the *Sūtra* is wholly unsupported by evidence.

³ ed. Vinḍhyeśvarī Prasāda Dvivedin, Benares, 1895, with Çrīdhara's comm., in part only with *Uddyāna's* comm., Benares, 1885-97.

stapada's indebtedness to Dignaga, a Buddhist logician whose most probable date is about 400 A.D., and it would accord well enough with all probability, if Praçastapada were referred to the fifth century. Between him and Çāṅkara appears to have intervened a *Rāvanabhāṣya*,¹ if we can trust an assertion of the commentator Çricāṇa on Çāṅkara's Bhāṣya but of this work, which may have been a comment on Kanada or on Praçastapāda, we know no more than that in his comment on the *Kīranā culiprakāṣa* Padmānābha asserts that it was used in Udayana's *Kīranavali*.

Of Vatsyāyana we know, if possible, less than of Praçastapada. His commentary, *Nyayabhāṣya*,² on the *Nyāya Sūtra* is not, like the Bhāṣya of Praçastapada an epoch-making text: it is based closely upon the Sutra itself, upon which it marks no decided advance. It is clear that Vātsyāyana knew the categories of the Vaiśeṣika, of which indeed, he makes use showing already the tendency of the systems to syncretism. But his logical doctrine is still meagre: inference is a mysterious thing really argument from analogy, while Praçastapada has a fully developed theory of invariable concomitance as the basis of inference. It is inconceivable that conservatism³ would have induced any writer to ignore the new advance made by Praçastapada, and this normal conclusion receives ample confirmation from the fact that Vatsyāyana was severely handled by the Buddhist logician Dignaga, who in all probability was the source

¹ Ibid., I. 12 n. That Praçastapada had predecessors is obvious and it is from one of these doubtless that Dignaga borrows the passages, cited in *Miss on*, v. 170-171 from his *Pravāṇasamuccaya*.

² ed. Benares 1896, BI 1864 5, Wind selb, *Ueber das Nyayabhāṣya*, Leipzig, 1888, trs. Ganganatha Jhi, *Indian Thought* iv. There are clear traces of an earlier commentary, see trs. ii. 43 n. There is no evidence of any corruption of his text.

³ Jacoby, *AGWG* 1901 p. 482

of Praçastapada's doctrine. It is reasonably safe, therefore to assign Vatsyayana to a period before A.D. 400. Of his personality we know nothing save that his name was Pakṣilasvamin.

The attacks of Dignaga were replied to by Uddyotakara the illustrator whose family name was Bhadravajra but whose personal name we do not know. He himself is silent as to the name of the author against whom his polemic is directed but the omission is supplied by his commentator Vacaspati Miśra and his statement is amply confirmed by what we know of the literary history of India. His date can be determined within fairly close limits. He cites a *Vadavadhī* and *Vadavādhanaṭika* which can with certainty be identified with the *Vadanyayī* and *Vadanyayatīkā* of the Buddhist logicians Dharmakīrti (about A.D. 630) and Vinītadeva respectively and in turn is referred to in fairly clear terms by Dharmakīrti in his *Nyayabindu* in which a system of logic based on Dignaga is set out. The date thus suggested is confirmed by the fact that Subandhu in his *Vasavadattā* refers to his establishment of the Nyaya evidently against the Buddhist doctrines and Subandhu's work doubtless fell in the seventh century. A reference to Çrughna in his *Nyayavarttika* even lends colour to the view that he lived at Thanesar and possibly enjoyed the patronage of the great Harsa (608-48) though tradition places his birthplace at Padmavati, now Narwar in Malwa which a century later was certainly celebrated as a school of logic.³

³ About A.D. 600 was written Candrabhāṭya's *Daçapadārthaçāstra* a Vaçesika treatise based on Praçastapāda preserved only in a Chinese version of A.D. 648 and without influence on the school in India (ed. & trans. H. U.).

CHAPTER II

THE SYNCRETISM OF THE SCHOOLS

1 *Vacaspati Miśra, Bhaṣarvajña, Udayana and Çrīdhara*

FOR practically two centuries after Uddyotakara there is no trace of the literature of the Nyāya until about the middle of the ninth century, there appears the *Nyaya varṭtikatātparyatīka*¹ of Vacaspati Miśra a commentary on Uddyotakara's treatise, the *Vyayasucinibandha* an index to the Sutra of Gautama and the *Nyayasūtrōddhara*, a brief treatise similar in character. Vacaspati was a man of remarkable versatility for he composed commentaries of the first order on Sāṃkhya Yoga Vedānta and Mīmāṃsā texts. He lived under a king Nrga and was a Brahman of Mithilā, his *Vyayasucinibandha* was composed in the year 898 as he tells us himself. The only doubt therefore can be as to the era to which this year refers. It would be necessary to refer it to the Çāka epoch and equate it with A. D. 976 if we were compelled to accept the tradition that the *Rājavarṭtika* to which he alludes in his *Sāṃkhyatātparyakāumudī* was a work of or dedicated to Bhoja of Dhara (1018-60), though even then difficulties would arise. But the tradition of this authorship is extremely uncertain, and it is certain that the author of the *Apohasiddhi*, a Buddhist logical tract freely uses Vaca

¹ ed. Gaṅgādhara Çāstri Tūlana Benares 1893

spati while ignoring Udayana of whom we have the date A D 984. The year 898 may therefore reasonably be referred to the Vikrama era and be equated with A D 841 in which case we must assume that Vacaspati wrote his commentary on Çankara's Bhasya on the *Vedānta Sūtra* some years later as Çankara probably flourished in the first quarter of the ninth century.¹

Possibly in the earlier part of the tenth century may be placed Bhasarvajña whose *Nyayasara*² is a brief compendium of the Nyaya in two chapters. It shows however while generally agreeing with Gautama and his commentators independence of view and Buddhist influence. Thus the old division of sixteen categories which the Buddhists rejected confining themselves to the topics of the means of proof and knowledge alone is set aside for a division of the whole subject into consideration of perception inference and verbal testimony as means of proof though the greater part of Gautama's logical and dialectical categories are dealt with in conjunction with the question of inference. More important is the rejection of comparison as a separate means of proof it is probable that here Vaiśeṣika influence is visible since the school rejected it *in toto*³ and Udayana who defends it makes it clear that its part in knowledge is reduced to ascertainment of the direct signification of words without regard to the realities signified. Agun Bhasarvajña shows a marked Çaiva influence. he

¹ See Woods *Logos Sūtra* pp. xx-xxi; Keil JPAS 1908 pp. 523 ff.

² ed. BI. Calcutta 1910 with Jayasukla Suri's *Nyāyatarjaya* p. 14 (fourteenth century). Cf. Hall *Bibl. of Index* p. 6.

³ SSS v. 33 recognizes a Vaiśeṣika school with three means of proof and so also a Nyāya v. 5). Unhappily the attribution of this text to Çankara is not certain; indeed probably wrong. The 21-fold division of pain (pp. 31-35) seems to be borrowed by SP § 61 bñt. of NV p. 2. TB p. 91 the work is freely used in TR and Kir p. 43 cites a Bhāṣana who may be the Bhāṣanākāra freely cited in TR.

goes so far as to style the system he expounds a Çaiva system and promises the earnest student who practises concentration the vision of the god himself. His work therefore may be assigned with some plausibility to Kashmir, where Çaiva belief was always strong. The precise date is possibly indicated if we can believe that the *Nyayabhisana* to which the Buddhist writer Ratnakīrti¹ in the tenth century refers is the commentary of that name on the *Nyayasara*, but the evidence is disputed. The work is however the subject of a commentary probably written in A.D. 1252: it is cited by Madhava and it appears established as an authority in Gunaratna's commentary on the *Saddarśanasamuccaya* of Haribhadra, and is, therefore, not later than the twelfth century. But it stands somewhat apart from the main stream of Nyaya, and it is certainly improbable that it could have been composed after Gaṅgeśa's work.

Of far greater importance both for the Nyāya and the Vaiśeṣika is Udayana whose date after many vicissitudes of opinion is definitely fixed at A.D. 984 by his own statement in the *Lakṣanavali*². He wrote a commentary on Praśastapāda's Bhāṣya the *Āraṇavali* and one on Vācaspati Miśra's commentary on Uddyotakara the *Nyayavāntīkatatparyapariçuddhi*³: much more famous is his *Kustumanjali*⁴ which is the classic exposition of the proof of the existence of God conducted from the point of view of the Nyāya system but accepting so far as in accordance with that system the view of the Vaiśeṣika. The same theme is sustained in a polemic

¹ SBNT, p. 11: the editor (p. 5) denies the reference.

² p. 94.

³ Keith JRAS. 1908, pp. 503 ff. Sialli *Inte.* pp. 61-62. Part of the *Kustumanjali* and the *Lakṣanavali* are included in the Benares ed. of Praśastapāda, 1885-9. A *Lakṣanavali* (not the *Lakṣanavali*) is cited in TP, p. 19.

⁴ ed. BI, Calcutta 1911.

⁵ ed. BI, Calcutta 1864.

against the atheism of the Buddhists and the Jains in the *Ālmatattivarivēka*¹ or *Bauddhadhikkāra* and to Udayana doubtless belongs the credit of making theism a principal tenet of the school though we have no reason to suppose him the inventor of the doctrine. On the first three of these works we have among others commentaries by Vardhamāna son of the great logician Gangeṣa and all his treatises and minor works were busily commented on in the Nuddea school. In him the tendency of the two schools to merge is strongly marked but he does not attempt a formal synthesis and cannot be deemed strictly a syncretist author.

There is much in common between him and Ānandadeva who wrote as he tells us in A.D. 991 his commentary *Nyayakāṇḍalī*² on Praśastapada's *Bhāṣya* and who appears to cite with disapproval in opinion of Udayana.³ Both recognize non-existence as a category by itself as opposed to the positive categories both accept the existence of God and both support it by arguments which have not a little in common. Yet a third commentator on Praśastapada may be ascribed to this period if we trust the record of Rajaṣekhara⁴ that Vyomaçiva's *Vyomavali* came first in the order of comments followed by the *Nyayakāṇḍalī*, the *Ānandavali* and the *Lilāvati* of Ānandadeva. It must be admitted that the order of the *Nyayakāṇḍalī* and *Ānandavali* seems wrongly stated but that Vyomaçiva preceded Udayana is stated by Vardhamāna.⁵ It is much more doubtful if he is to be identified with Ānandadeva author of the syncretist *Sūtrapadārtha* especially as he recognized three means of proof as against Ānandadeva's two.

⁴ Peterson *Report for 1894* 6 p. 272; cf. Gunaratna *BSAI* xx 64 where no order is given and the name is *Vyoma nati*.

⁵ *Kir* p. 114 n. 3.

Of doubtful date is Jayanta Bhatta author of an exposition of the Sutra, the *Nyayamanyatī*¹, and *Nyaya-lalīkā* whom Gaṅgeṣa mentions as one of the old Nyaya school, like Bhasarvajña he appears to have been a native of Kashmir. He cites Vacaspati and is cited by Deva Suri (A D 1088-1169)

2 *Gangeṣa and the Auddea School*

Probably within two centuries from Udayana and Çivāditya there flourished the famous Gaṅgeṣa or Gangeṣvara, the author of the *Tattvacintamani*² in which the logic of the Nyaya attains its final shape. A native according to tradition of Eastern Bengal he must have lived after Udayana whose proof of the existence of God has plainly influenced his treatment of the inference of God and after Çivāditya and Harṣa, whom he cites. On the other hand one of his commentators Jayadeva is the author of a work the *Pratyakṣuloka* of which a manuscript³ bears the apparent date of Lakṣmīnasena epoch 159 or probably A D 1278. Jayadeva is also the author of the *Prasannaraghava* a drama of no great merit and it is improbable that his date is later than A D 1200, so that as Jayadeva studied under an uncle of his, Hari-miçra, it is not improbable that Gangeṣa may be referred without great risk of error to A D 1150-1200. His treatise follows the model hitherto only seen in Bhasarvajña of an independent treatise on the Nyaya in which the dialectical portion which forms the main part of the

¹ ed. Benares, 1890. See Keith, *Akarma Mimāṃsā*, pp. 15-16.

² ed. BI, Calcutta 1808-1800. cf. *I O Catal.* pp. 611-33.

³ Mitra, *Voices* v 290-300. Candrakānta, *Kusumajyoti*, pp. 22 ff. Vindhyeśvarī, Prasāda TR., pp. 21-4 whose dating is probably wrong resting on the assumption that Bhaṅgīratha Thakura (alvo in A D 1500) was a direct pupil of Jayadeva, which is not necessarily the case. His drama is before A D 1200.

Sūtra is made to yield the place of honour to the systematic treatment in four books of the four means of proof, under inference being included a special treatise on the inference of God. Thus the doctrine of the theory of knowledge is presented in a definitive form freed from intermixture with the miscellany of contents of the Sutra and placed in a position to confront the attacks of the Buddhists and the Jains. So well done also is the task that it proved the last work of outstanding merit in the school those who followed abandoned the study of the Sutra and the commentaries to devote themselves to the minute discussion of the points which were early raised as to the interpretation of the views of Gangeśa and the correctness of his opinions.

The tradition of the *Tattvacintāmanī* was carried on by Vardhamana¹ the son of Gangeśa whose tradition ascribes to Mithila and who wrote a commentary on his father's work as well as dissertations on other topics and comments on Udayana's three main treatises. Not much later presumably was Hariniçra whose nephew Jayadeva's *Aloka* is a comment on the *Tattvacintāmanī*. A pupil of Jayadeva was Rucidatta, the author of the *Kusumājalīprakāśamukharandā* a commentary on Vaidhamāna's comment on the *Kusumāgilī* and other works.²

There follows then a clear break in the tradition³ which legend seeks to fill up by assigning Jayadeva as

¹ Lists of the works of the members of the school are given in Aufrecht's *Catalogus Catalogorum* i. 1. It is common Nyāyaprakāśanī bandha on Udayana's Nyāyacūṭīkāśīlpaṇyapariśuddhī freely gives his father's views as opposed to Udayana's. He also wrote an independent comment on the Sutra, *Ind an Thorghī* vi. 297-298.

² The assumption to him of a commentary on a work of Raghudeva (*Catalogus* i. 508) is an error. If Jayadeva's date is as taken above.

³ Candrakānta *Kusumājalī* pp. 24 ff. Vidyhegyvari *Pravāda*, PBI (1885) pp. 30 ff. Bodas TS pp. 44 ff. 5 al. *Ind* pp. 81-4. Keith

a contemporary of Vasudeva Sarvabhauma author of the *Tattvacintāmanirāṭhā*, an exposition of Gangeśa who may be regarded as the first of the Nuddea (Nuddea) school of lower Bengal. Vasudeva had four famous pupils Caitanya the Vaiṣṇava saint and reformer Kṛṣṇananda a great authority on Tintre rites Raghunandan the renowned lawyer and Raghunatha the greatest logician after Gangeśa. The commentary of the last on the *Tattvacintāmanirāṭhā* covers the first two books only, thus dealing with the really philosophical parts of the system. In addition to the *Dīdhiti* Raghunatha was author of *Padvīlakhaṇḍana*¹ or criticism of the Vaiśeṣika tenets and other works. He had as pupil Mathuranatha a commentator of prodigious fertility both on his master's work and on the *Tattvacintāmanirāṭhā* itself. Tradition makes him a teacher of Raghudeva and if so he was a contemporary of Harirama Tarkalankara who was certainly the preceptor both of Raghudeva and of Gadadhara. To all three authors the school was indebted for many works based on Gangeśa and Raghunatha exhibiting a vast mass of perverted ingenuity worthy of the most flourishing days of medieval scholasticism. As Caitanya's dates are known we can safely assign the period of Vasudeva's influence to the beginning of the sixteenth century and with this accords the fact that Mathuranatha is held to have been a contemporary of Jagadīśa author of a commentary on the *Dīdhiti* who certainly lived about A.D. 1600. On this work of Jagadīśa a comment was composed by Çāṅkara Miśra who was a pupil of Raghun

Eastern Cat. App. pp. 3, 4 Vindhyeśvarī Prasāda (*Khaṇḍanāṭhāṇḍana* pp. 4-5) asserts that a MS. of the *Khaṇḍanāṭhāṇḍana* of Çāṅkara Miśra is dated as A.D. 1509 (= A.D. 1490). This contradicts the references in *Catalogue* i, 16 to commentaries by him on Jagadīśa and Gadadhara and pupilship of Raghudeva and is open to doubt.

¹ ed. as *Padārthatattva-viṣaya The Fund.* xxiv xxv

deva but who is much more famous as the author of the *Upaskāsa* a complete commentary on the *Vaiṣeṣika Sūtra*¹ the first as yet available for Praśastapada's Bhaṣya is a restatement rather than commentary. The work is however far removed from the original which it interprets often in a manner obviously impossible of acceptance.

The reversion to the Sūtra as a source of guidance seen in Ćankara Miṣra who asserts his independence in his work has a curious contemporary parallel in the action of Viṣvanatha author of the syncretist work the *Bhasapariṣeḍḍi* in writing a formal commentary to the Sūtra of Gautama². The mass of comment had at last it seems wearied the authors and induced them to return to more original sources of knowledge.

3 The Syncretist School

The fullest development of the tendency to syncretism in the schools is seen in the work of Ćivaditya who must be reckoned the earliest of the authorities of the joint school though it may safely be assumed that he was not the first thus to amalgamate the systems in exposition. The *Saptapadārtha*³ is based on the *Vaiṣeṣika* system in its arrangement and treatment following the order indicated in the fourth aphorism of Kāṇada's Sūtra he enumerates the categories and their subdivisions explains the purpose of the enumeration and

¹ ed BI Calcutta, 1861 with a *Vivṛti* by Jayanārayana a recent commentary is that of Candrakānta Calcutta 1887. An edition by Gangadhara (1868) purports to be based on a *Bhāradvājya* but is clearly unauthentic. Faddegon pp. 34-40.

² Another commentary *Bhasyacandra* on Vātsīyāna and the Sūtra has been found. In *Indian Theology* v. 379. It is by Rāḡi Śūkama.

³ ed Rāmācāstri Tāilanga Benares 1893. V S Glaste Bombay 1909, trans. A. Winter ZDMG l.

the nature of supreme felicity which constitutes the end and then gives in detail the exposition of the matter set out in the enumeration. On the other hand, he introduces the substance of the Nyāya logic which is included under the quality cognition though he does not expressly set out the Nyāya categories. His date is uncertain, he is known to Gaṅgeśa,¹ and unlike Udayana who treats non existence as a category opposed in a sense to the six of existence he makes it a seventh category. This points to a date after Udayana. On the other hand if, as suggested by the colophon of one manuscript—not a strong piece of evidence he is identical with Vyomaśiva author of a comment on Praśastapada he is probably anterior to Udayana who in one place cites a view of a teacher whom Vardhamana identifies with Vyomaśiva and Rajasekhara mentions Vyomaśiva's commentary as prior to Ācārya and Udayana's. But identification with Vyomaśiva rests on too slight a basis for serious argument. He wrote also the *Lakṣanāmālā*. On the *Saptapadārthi* there are many commentaries of which may be mentioned those of Jinavardhana Suri (c. A. D. 1415) Madhava Sarasvatī (before A. D. 1523) and Ćaśa nanta (before A. D. 1608).

Nor less uncertain is the date of Keçava Miçra author of the *Tarkubhāṣā*.* His work follows the order of the Nyāya school but he shows the full influence of the Vaiçeṣika enumerates its categories and is influenced by its doctrine of causation and perception. Moreover his logic is on the same plane as that of Gaṅgeśa and he cites Udayana. On the other hand his commentator Cinna Bhaṭṭa wrote under Harihara brother of Bukka I of Vijayanagara in the first half of the fourteenth century.

¹ TC I. 83, 84, 85, p. 9 above, p. 32

* ed. S. M. Paranjape, Poona 1894 (2nd ed. 1909) trans. Gaṅgā nātha Jhā, *I id an Thought*, is

and therefore Keçwa must fall not later than A D 1300 possibly earlier. Of commentaries there are those of Govardhana whose brother wrote in A D 1578 Gaurikanta and Madhivadeva (before A D 1681).

More recent doubtless is the *Tarkakamudī*¹ of Laugakṣi Bhaskara which is a clear and elegant exposition of the syncretist school, following the Bhasya of Praçastapada. The author was son of Mudgala and grandson of the poet Rudra and the only hints we have of his place and time are the facts that he refers to Benues and to a philosopher Çulapani Miera who conceivably may be identified with Çankara Miçra the commentator on the *Vaiçesika Sutra*. The similarity of his style and manner of treatment to that of Annam Bhatta and Jagadiça render it reasonable to suppose that he was of approximately the same period. He wrote also on the *Vaiçesika* and on *Mimamsa*.

Jagadiça is of more certain period: a pupil of his was alive in A D 1649 and he was pupil of Bhavananda father of Vidyānivaśa and grandfather of Viçvanātha who was alive in 1634 so that Jagadiça must have lived about 1600. He was one of the most industrious of the Nuddea school, and his *Tarkamṛta*² is marked by an innovation in arrangement: while he mentions cognition as a quality of the self under the category of quality, he reserves its treatment at large for the end of his treatise thus restoring the topic to a position more in keeping with its true importance. Viçvanātha was a younger contemporary: his commentary on the *Ayaya Sutra* was composed in A D 1634. His syncretist treatise is the *Bhasapariççela*³ in which in 168

memorial verses of the most prosaic kind he summarizes the topics of the system, the arrangement is an exposition of the categories and their subdivisions followed by an account of their analogies and differences and then an elaborate description of substance and quality. Cognition is treated of as a quality of substance but also by way of supplement in a later part of the text. The verses are explained in the author's own commentary the *Siddhāntamuktavali*. Both works are distinguished by the comparative clearness of their exposition which is based on Raghunātha Ćiromani and have formed the subject of many comments.

Last but not least is Annam Bhatta whose name like that of his father Tirumala indicates his connexion with the Telugu country. His date is uncertain he seems to have used Raghunatha's *Dudhiti*, and tradition attributes to him knowledge of Gadadhara whence his date may fairly be placed not before A.D. 1600. He wrote also on grammar on Vedānta of which his father was a teacher and on Mimāṃsa. His syncretist work is the short *Tarkasamgraha*¹ which in eighty one paragraphs sums up the system in the same order as the work of Laugakṣi Bhāṣaka. More important is his own commentary the *Tarkasamgrahadīpikā*, which discusses the definitions given in the text amplifies the statement, and occasionally corrects it a sign that it was composed after the issue of the text. Important commentaries are Govardhana's *Ajayabodhini*, whose author was apparently different from the commentator on the *Tarkabhāṣa*; Kṛṣṇa Dhurjati's *Siddhāntacandrodaya*; the *Nilakanṭha* of Nilakanṭha who died A.D. 1840 and his son *Lakṣminisinha*'s super-commentary *Bhaskarodayā*.²

¹ ed. V. V. Atlaly. Bombay 1897. trans. L. Hultsch. ACWG Phil. hist. Klasse ix. 5. Berlin 1897. ² ed. Bombay 1902.

Of greater extent and importance is the polemical treatise *Tāṭhikarākṣa*¹ of Varada Acārya consisting of memorial verses with a prose commentary (*Sarasān graha*) in three books, in which the order of the Nyaya is followed. The date is after Vacaspati Udayana Jayanta and Bhusanakara presumably the commentator on the *Nyayasūtra* but before Madhava who uses the work in the *Sarvadarśhanasamgrāha*. Nor is there any reference to Harsa (A.D. twelfth century) whose *Akhandanakhanda* had² is an elaborate refutation from the point of view of sceptical Vedantism of the Nyaya system in the course of which much useful information of its details is given. A comparatively early date is also suggested by the fact that the commentator Jñāna purna gives as his teacher Viśnusvamin who may be the predecessor of Nimbāditya and if so falls in the eleventh century A.D. There is also a comment by Mallinatha (fourteenth century).

Of uncertain but not early date is the *Nyayasiddhānta mānjarī*³ of Janakīnātha Bhaṭṭācārya Cudamani which in four chapters deals with the means of proof of the Nyaya system and has been commented on freely among others by Laugakṣi Bhaskara and Yādava. Other treatises both general and on particular points are numerous but do not reveal original thought.

From Gaṅgeśa and Jayanta onwards reference is frequently made in the texts to ancient and modern schools.⁴ The precise signification of these terms is often in doubt in some cases the distinction is between

the Vaiśeṣika and the Nyāya views in others between such authorities as Vatsyayana and Praçastapada in contrast with the Nuldei school or even merely between those of Gaṅgeśa and of Raghunatha Ćiromani and his followers. Uddyotakara already refers to many diverse views held in the school itself, and Jayanta alludes to many opposing views of which traces here and there occur in the later literature as in the *Sarvasiddhānta-saṅgraha*.

PART II

THE SYSTEM OF THE NYĀYA-VAIŚEŚIKA

EPISTEMOLOGY

CHAPTER I

KNOWLEDGE AND ERROR

1 *The Nature and Forms of Knowledge*

COGNITION (*buddhi*) in the Nyaya Vaiśeṣika is essentially a property of the self being described as a quality it differs, therefore, from either the act of understanding or the instrument as which it ranks in the Sāṃkhya school. The function of instrument falls on mind which also performs the function of perceiving cognition though it itself is imperceptible. Cognition receives in the early texts no serious definition. Gautama¹ gives it as synonymous with knowledge (*jñāna*) and apprehension (*upalabdhi*), while Praṣastapada² merely adds another synonym, comprehension (*pratyaya*). Ānandīya's³ contribution is the definition as 'a light which abides in the self'.

A nearer approach to reality is made by Keṇaśa Mīṣra⁴ who gives among other alternatives the suggestion that cognition is what makes things understood. Annam

¹ I. 1. 13

² § 93

³ p. 171 VSU viii f. 1

⁴ p. 89 TR p. 125 see Laṅkā p. 11

Bhatta¹ describes cognition as the special cause of the utterance of words intended to communicate ideas suggesting the view that cognition is a quality of the self, through which the latter has at once the idea to express and the word to give it utterance. This definition, however fails to include the case of indeterminate perception which is equivalent to bare sensation and cannot be expressed in language. More complete and fundamental is the other definition given by the same author, which makes cognition the knowledge which forms the content of the consciousness expressed in the phrase I have this consciousness. The essence of this aspect of cognition is the recognition of the reference to self, which is implicit in ordinary consciousness. From the contact of the external thing and the organ of sense mediated by mind the self has the cognition. This is a jar. This cognition of a jar (*gl'ata-jana*) is therefore a property of the self a fact expressed in the judgement I am possessed of the knowledge of a jar or more simply I know a jar. Cognition thus conceived is styled *anuvyavasaya* because it is consequent upon mere consciousness of an object a point in which the Nyāya Vaiśeṣika departs from both the Sāṃkhya² and the Vedānta³ who do not recognize that the simple consciousness is thus the content of a further consciousness involving reference to the self and give to a single consciousness the duty both of cognition of an object and of cognition. In the Sāṃkhya view all is mechanical process without consciousness until enlightenment takes place through the soul which at the same time is

§ 34

revealed¹ In the Vedānta doctrine there is nothing ultimately save knowledge which reveals itself and this also is the position of the Viśṇuavāda or Idealist school of Buddhism though it differs *fundamentally from the Vedānta* in denying the existence of a single intelligent abiding principle and admits only a series of impressions which in some way or other must be conceived as giving self-consciousness To this view the logicians are entirely opposed they insist on the distinction of the self which knows the cognition and the object cognized and refuse to permit consciousness to play all three parts Thus they differ from the Sautrāntika and Vāibhāsika schools of Buddhists which accept external reality either as inferred or directly apprehended but unite in one the agent and the cognition itself and agree with the Prābhākara school of Mīmāṃsā which however does not accept the principle that mental perception gives knowledge of the self as cognizing but assigns this function to the form of inference classed as presumption the existence of a *cognizing self being essential to explain the fact of cognition* The position of Kumārila is less clear but he seems to have more closely approximated to the Nyāya view while admitting the Vedāntic doctrine of the self as consisting of pure consciousness²

Knowledge therefore is primarily directed to something not the knower himself who is only apprehended either directly by mental perception as cognizing feeling or willing or as the Vaiśeṣika holds inferred as the substrate of these mental acts which it admits unlike

Prabhakara to be the objects of mental perception ¹ Knowledge whether true (*yathārtha*)² or false (*ayathārtha*) *prama* or *aprama* in the Vaiśeṣika terminology is a representation of reality. In each judgement there is an object of knowledge (*vicesya*) which possesses in reality certain attributes (*vicesana*) this attribute is represented in the judgement by a characteristic (*prakara*) which if the judgement is to be true, must correspond to the attribute as it really exists. The judgement This is a flower asserts that a portion of reality presented to us has certain attributes which are summed up in the characteristic of being a flower. This flower is blue does not differ³ in any essential from such a judgement both being equally analytic and synthetic in both reality presented is accorded a characteristic which ought to correspond to the real attributes of the object. Correct apprehension may therefore briefly be described⁴ as that which attributes to an object with a certain attribute the corresponding⁵ characteristic (*tadvatī tatprakāraḥ*) while false apprehension is one which ascribes a characteristic to a thing which has not the corresponding attribute (*tadabharavatī tatprakāraḥ jñānam*)⁶

This is a perfectly definite if difficult theory of judgement and it is defended with energy against opposing views. To Prabhakara consciousness not involving memory alone gives true knowledge⁷ in the view of

Kumarila¹ a means of proof is that which determines as such a thing not previously experienced. To these views the Nyaya has the obvious objection that in any judgment which is articulate there must be recognition which involves memory but the Mīmāṃsā answer is that cognition essentially consists in the production of a quality of cognizedness (*jñatata*) in the object which then becomes the object of perception as e.g. 'This jar is known' and that this quality is generated on each occasion. To this the Nyaya reply is that cognition has no special form but is rather a potency which receives in each case its special character from the attribute abiding in the object. Cognition must not be regarded as transforming what it cognizes: to be cognized is no quality of the object but a relation *sui generis* (*svarūpa sambandha*) existing between the object and cognition. The Mīmāṃsā doctrine of the grounds of validity of ideas is also criticized. The most advanced form of the doctrine is that of Prabhakara who maintains flatly the truth of every cognition as such as is indicated by the fact that the water we actually see and the water seen in a mirage produce similar tendencies to action on the part of the percipient. All direct apprehension is valid: indirect apprehension due to memory introduces invalidity. When a piece of shell is mistaken for silver the process is due to memory which through properties common to the shell and silver produces recollection of silver not differentiated as it should be with the mark of its past character. So also memory accounts for the apparent seeing in dreams of non-existing things. In other cases where there is apparent error it does not lie in the cognition. The man whose vision is defective sees two moons; the images not being fused in one as usual, the man who sees the whit

¹ PSPM pp. 91-5 99-31 CV pp. 28 ff CD pp. 15-30 TP pp. 39-54, SDS. pp. 106-107 BP 135

conch as yellow fuses the perception of the conch with the yellowness of the bile which prevents his eyes seeing true. Kumārila is equally clear that the cognition is really true, what is in any case corrected is not the cognition but what is cognized giving the doctrine of the self evidence (*svataḥ pramānya*) of cognitions subject to external invalidation. The two forms of such invalidation are discovery by other means of the real character of the object and discovery of defects in the instruments of cognition such as bile in the eyes. Though the older Nyāya¹ tradition is not so emphatic on the subject as the later it is claimed by both that the self evidence of cognitions is unsustainable². The truth of a cognition must be established by an inference, ultimately by an appeal to facts. If every cognition carried with it its validity it would be impossible for us to feel as we unquestionably do doubt. In point of fact the real process is that on the judgement 'This is a horse' there arises the further judgement 'I see a horse' and its validity is proved by actually handling the object. Similarly a cognition of water is held valid only because we have been accustomed to verify it by drinking the water and come to hold its truth without verification in each case but subject always to such verification. The true nature of false cognition therefore does not lie in any confusion of what is perceived and what is remembered through some defects of the organs of perception we apprehend something incorrectly, and then *ab extra* correct not our cognition, which was as accurate as its mode of production permitted, but the result of the cognition, the silver which we believed we saw is replaced by the shell we really had

before us. Error thus lies not as in the Mimamsa view in non apprehension (*a khyati*)¹ whether of the thing or of difference between what is seen and what is remembered but in misapprehension (*an jati i khyati*)². The divergence of view between the two schools as to the self evidence of cognition was of the greater interest to either as the Mimamsa view allowed its supporters to maintain the self evident truth of the uncreated Veda while the Nyaya maintained that the authority of the Veda must rest on its production by an omniscient creator.

The Nyaya refuted also the Sautrantika Buddhist view which following Dharmakīrti³ regards a means of proof as that which determines an object. Thus it is argued cannot be sense for the eye gives us diverse colours, but must be the form (*al ar i*) of the object which cognized affects cognition with its specific character and thus determines the object. Similarity with the object is thus declared to be the means of proof since by reason of it apprehension of anything takes place⁴. This view also is rejected the form can be nothing but the idea and the idea can neither produce nor make known nor determine itself it cannot act on itself to create itself it cannot make itself known in view of its very nature nor can it give rise to a judgement 'I know this as black' based on itself as 'This is black', for in a cognition which is self illuminating like that assumed by the Sautrantika these two sides are inseparably connected. At best the idea could only be deemed a means of proof by virtue of its pointing to the external reality whence

¹ NL pp 61 3 NVT pp 55 ff NVTP pp 417 ff KKK i 214

⁴ NVT p 12 NVTP pp 122 4 1 7 80

it is derived and the use of language forbids us to regard as a proof a thing which does not produce even if like the supposed form it determines in this sense true knowledge. It is obvious also that in the Sautrantika view the Nyaya criterion of truth conformity with external reality disappears and nothing is left but ideas whence the mere existence of an outer reality is inferred as an explanation of their existence but not of their specific forms¹

Still less does the Nyaya accord with the purely idealist theory of Buddhism which regards ideas as the sole reality and finds that there is identity between cognizer cognition and its object externality thus is due to an error which causes what is really part of an internal series of cognitions to be regarded as something external (*atma khyati*)² The Nyaya naturally objects strongly to a theory which deprives the external world of all reality they insist moreover that if all is but idea it would be impossible to have such judgements as

This is blue since the judgement would necessarily 'take the form I am blue' which is absurd. It is not denied that there may be confusion of what is external and what is merely internal in individual cases but that is simply a special instance of the general doctrine of error as misapprehension accepted by the Nyaya. Still more objectionable if possible is the nihilist doctrine of the Madhyamikas according to which all apprehension is of the non existence (*asat khyati*)³ and is itself non existence a view based on the allegation of the incompatibility of all notions.

On the other hand the Buddhist schools have strong arguments to urge against the Nyaya doctrine of know

Below ch 4 § 1 ch 11 § 1

¹ NVT p 54 NVTP pp 409 12 VPS : 85 ff

² NVT p 53 NVTP pp 412 413 GK i 141 i 189 240

ledge¹ Perception plainly rests largely on recognition which alone makes it articulate, but is recognition valid? Sense is sense and impression impression, how can they fuse to produce a whole or give testimony to the continued existence of a substance in time? Assuming that there is a fusion what is perceived can only be either a pure case of remembrance if it refers to the past or imagination if it refers to the future or of present apprehension for, as the previous cognition is past, it cannot be possible to apprehend a thing as qualified by a previous cognition. To this argumentation the Nyaya reply is simple the sense organ as affected by the impression is ample to produce the result, when in eating fruits we come to our hundredth we recognize it as such by reason of those we have consumed already, the past is gone but the relation with the past is real. Recognition gives us knowledge of present objects as qualified by the past or, if we prefer as qualified by previous cognitions of themselves.

In the *Nyaya Sutra*² itself a determined effort is made to meet the Buddhist argument that correct knowledge was impossible of attainment by reason of the impossibility of any of the three possible time relations (*trairūpya*) between means of proof and its object. Thus if perception precedes colour, it cannot be as held by the Sutra, due to the contact of sense organ and object, if it follows on colour, then you cannot say that perception as means of proof establishes colour, if simultaneous then we would have at one moment two cognitions which is impossible on the Nyaya view, and similar arguments can be applied to the other means of proof. The reply given is that, if there are no means of proof you cannot prove that fact. The difficulty of time is

¹ NM, pp 448 ff, TC. i. 839 ff, cf VPS. i. 177-81. ² KKK. i. 166 ff demolishes all the proofs of Nyaya, NSM, p. 12

³ ii. 1.8.19 Cf NSāra pp 20-21, Nāgārjuna in U. p. 82

not real, there are in fact diverse relations, thus a drum precedes its sound illumination succeeds the sun and smoke and fire are contemporaneous, and so with means of proof and what is proved. An object of proof is weighed as it were in the balance of means of proof, and so with the means itself. If it is objected that, as each means of proof has to be established by another means then the object will need a series of means of proof and not one only, or, if means of proof establish themselves then why not the object of proof? the reply is that means of proof are established like the illumination of a lamp, an expression which suggests that to Gautama perception and other means of proof proved themselves.

Another difficulty as to knowledge presents itself from the Nyāya view of its transitory character,¹ which is proved by the fact that recollection is only possible because knowledge does not last, but is a constant series of cognitions. If so, how can things be known distinctly for there is no clear perception of colour in the lightning flash? The example, it is replied does illustrate the truth of the Nyāya proposition, we have only a hasty vision of the lightning and so an imperfect perception but a clear perception is attainable when there is continuity of momentary impressions as in the case of the rays of a lamp which themselves are transitory, but of which by the continuity of the experience we obtain clear knowledge. The answer is ingenious for the Nyāya doctrine of the transient character of cognition had obviously dangerous affinities to the Buddhist doctrine of the momentary character of cognitions and their falsity.

On the other hand, the Nyāya² equally rejects the

¹ *ML* 2. 40-9. Cf. the difficulty as to the possibility of *anuvyavasāya* discussed *TC* i 504 ff., below, ch. vii, § 5.

² *ML* 2. 1. 10, cf. Kumārila, *CV*, pp. 382-408, *SS* : 145, *NBh*, *NV*, *NVT*, i 1. 15.

permits of the apprehension by the internal organ of the self as modified by that organ and empirically existent, thus in some degree aiding the Nyaya contention. The Jain¹ view again recognizes the distinction of cognizer, cognition and cognized, but tends to accept the Mīmāṃsā view of the self evidence of cognitions. It is possible as we have seen, that this was Gautama's own view, for his commentators² are driven to argue that the *regressus ad infinitum* of the proof of perception, &c, by other means of proof is evaded by the fact when being proved a means of proof ceases to be such and becomes an object of proof. The more fruitful conception of truth as a system was evidently impossible for them as rigid realists. Knowledge for them is rendered possible by the reality of generality and particularity whose simultaneous presence in perception³ lies at the root of all judgement and inference.

2 The Forms of Knowledge and Proof

Cognition is variously divided in the texts of the schools. Praçastapada⁴ adopts as the *principium divisionis* the distinction between true knowledge and false knowledge. the former is subdivided into four categories (1) perception subdivided as omniscient which is possessed only by a divine intelligence and non omniscient which is appropriate to man and manifests itself as indeterminate or determinate, (2) inferred knowledge (3) remembrance, and (4) the insight of seers (*āṛṣa*) which is a peculiar form of perception possessed by these adepts alone. In the accepted doctrine of the syncretist school⁵ which follows the Nyaya tradition cognition is

¹ Siddhasena NA 3 with commentary

² NBh, NV, NVT, II 1 19 TC 1 278 ff

³ Criticized in *Advaitaśilī* trans, pp 93 ff

⁴ pp 172 ff

⁵ Cf NS 1 1 3 ff

divided into the two great heads of apprehension (*anubhava*) and remembrance (*smṛiti*). The former is then divided into (1) perception (*pratyakṣa*), (2) inferred knowledge (*anumiti*), (3) analogical judgement (*upamiti*), and (4) verbal knowledge (*śābda*). The latter has no distinct species though the question is raised and decided in the negative of the inclusion in it of recognition (*pratyabhijñā*). Of perception there are two distinct kinds that of God which is omniscient and eternal and that of man which is transient and which may either be true or false. The other kinds of knowledge are proper to man as opposed to God and admit therefore of truth and falsity. In the case of perception there is recognized also for man an essential difference between indeterminate and determinate perception in the former of which man comes into direct contact with the world of reality without him. This division of forms of knowledge covers the whole field. axioms in so far as they receive any recognition in the system fall under transcendental perception, which is a special form of determinate perception and belief is included under verbal knowledge.

The four kinds of apprehension are ascribed to four kinds of means of proof (*pramāṇa*) by Annam Bhatta, as by Gangeṣa making explicit a relationship which does not so explicitly appear in Gautama. The term *pramāṇa*, however is not without ambiguity. By Vatsyayana¹ it is defined merely as an instrument of knowledge, that by which the knowing subject knows the object'. The ambiguity left by this definition which is applicable in a purely psychological sense, is cleared up in the definition of Ācārya² which ascribes to a *pramāṇa* association with true knowledge (*pramā*)

a view which brings out at once the fact that a *pramana* produces knowledge and that if it is to deserve its name that knowledge must be true i.e. in accord with reality Annam Bhatta¹ and Keçava Miçra² recognize that the logical implication is as necessary as the psychological and Madhava³ gives a fuller definition which emphasizes this and other features necessary in a true *pramana*. Means of proof in this view is that which is always accompanied by true knowledge and at the same time is not disjoined from the appropriate organs or from the seat of consciousness i.e. the soul. The expression accompanied (*vyapta*) which here takes the place of cause (*karana*) in describing the relation of *pramana* to *prama* is used to convey the fact that the means of proof does not merely produce knowledge but assures its correctness while the addition to the definition makes it clear that means of proof is different from the self the mind or the organs of sense though all these have their parts to play in mental activity. The true sense of *pramāna* thus appears not as a mere instrument of proof but the mode in which the instrument is used the process by which the knowledge appropriate to each means of proof is arrived at. The definition of Madhava has in his view the further recommendation that it includes implicitly the doctrine of the Nyāya⁴ that God is the fountainhead of all true knowledge since God is the seat of all knowledge and is ever conjoined with it.

As all truth depends on agreement of knowledge and reality each of the modes of proof must conform to this test in the mode appropriate to it. In the technical phraseology of the Nyaya this doctrine takes the form that each cognition is true in virtue of a quality (*guna*)

TS § 34^a Cf. NSāra, p. 1 TR p. 8

² pp. 8-9

³ SDS p. 92

⁴ NS ii 1-69 Kus iv 5-6 TR pl. 11-12 55 NYTP p. 2

which it possesses and is false in virtue of a defect (*dosa*), or more simply a cognition is true or false as it fulfils or fails to fulfil some requisite. Thus a perception is true if the object really possesses the attributes which correspond to the notion expressed in the judgement of perception, an inference if the process of inferring is based about a subject which really possesses the qualities which in the conclusion are inferred of it a comparison if the similarity is rightly apprehended as existing, and verbal knowledge if the compatibility of the words heard is known. These conditions are defeated by such conditions as in the case of vision bile in the eye or excessive distance or in the case of inference by logical errors of any kind.

There is, however a serious divergence of view between the Nyaya and the Vaiśeṣika regarding the number of means of proof. The syncretist school with the exception of Ācārya follow the Nyaya¹ and accept four perception which inconveniently enough bears the same name as the resulting knowledge though *sakṣātkara* is occasionally used for the latter inference (*anumāna* as distinct from *anumiti*) comparison (*upamāna* as opposed to *upamiti*) and word or verbal testimony (*śabda* as opposed to *śabda*). From the normal Nyaya list there is however a departure in the case of Bhaṣarvajña by whom comparison is included under word the means of proof thus being reduced to three while the Vaiśeṣika refuses to accept the separate validity of comparison and word which they reduce to inference. The Buddhists likewise accept in a sense perception and inference as proofs while the Jains in one school divided means of proof into direct and indirect and included perception under the first inference and

¹ TC 1 503 15 * 860-6 TR pp 55 56 Some Vaiśeṣikas allowed verbal testimony SSS v 83 Vyomaś va GSAI xx 63

word under the second¹ The same three were adopted by the Samkhya² the Yogas³ and in part by the Vedanta though in the strict sense revealed truth alone exists for the Vedanta The Mimamsa and the normal Vedanta view accept in addition to the four of the Nyaya intuition or presumption (*arthapatti*) and some Prabhakara also non perception (*anupalabdhi*) The latter in the Nyaya view in only an accessory condition of the direct perception of non existence,⁴ while the former is reduced to a form of inference The number was raised to eight by the Pauranikas who included tradition (*aitiḥya*) and equivalence or inclusion (*sambhava*) among the means of proof the former the Nyaya naturally reduced to word while the latter falls under inference A ninth gesture (*cesta*) added by the Jantrikas falls under word and elimination (*pariṣesa*) which some Mimamsa authorities made a separate proof is plainly part of inference On the other hand the Carvaka school reduced to perception alone understood in the narrowest sense the means of proof a doctrine which they had to establish unhappily for themselves by inference while like the materialism which it accompanied it was entirely opposed to the whole system of the Nyaya⁷

Remembrance as a rule lies outside the field of the

operation of the means of proof Laugakṣi Bhāṣkara¹ alone frames his definition of means of proof so as to cover remembrance.² The reason for the omission is clear remembrance itself has no independent value being based on previous experience and the normal opinion is satisfied with referring its character as true or false to the original whence it is derived. There is the obvious difficulty moreover that a remembrance may be hard to verify as compared with the original impression if time has elapsed or the subject of the experience has gone to another place. It is obvious however that the mere reference for the truth or falsity of remembrances to the sources whence they were derived is not completely satisfactory if the original impression were correct there may be forgetfulness in whole or part but the nature and condition of such errors are not the subject of investigation. Remembrance is traced to an impression (*sa śāra bhūanā*) produced by experience which must be regarded as in some manner a mental operation (*vyākara*) which functions until it results in remembrance when an idea is recalled by an apprehension which awakens it (*udhoḥḥa*) by relations of various kinds.³

As the product of an abiding impression alone⁴ remembrance differs from recognition (*pratyakhy*) which is also in part due to an impression but has as its immediate cause the presence to perception of some object of previous experience recognition thus being due to sense accompanied by an impression produced by a previous apprehension.⁵ Or from another point of view the cause

of recognition is the knowledge of the identity of the new and old experiences rather than an intermediate process of remembrance, or, as Çivāditya has it, recognition is the perception of an object qualified by the idea of being past. The importance of the part played by memory, however, is not denied, and in the developed doctrine of determinate perception some recognition is given to the part played by memory in our actual concrete perceptions.

Apart from its character as knowledge, cognition is of vital importance from the standpoint of the interests of man. Taking the traditional fourfold division¹ we have that which is to be avoided (*heya*), that is pain and its sources, ignorance, desire, merit, and demerit, that which destroys pain (*hāna*), the knowledge of truth, that which brings this about, the science, and the final end, the removal of pain, and of these the knowledge of truth, or the instruments which produce that knowledge, ranks highest. Knowledge, we must remember, is not for its own sake alone, Çivāditya² recognizes an essential feature of the system when he classifies it, at first sight irrationally, according to its nature as mere recognition, acceptance as attractive (*upadāna*), rejection as painful (*hana*), or treatment as indifferent (*upekṣa*)

3 The Nature and Forms of Error

The essence of false knowledge (*apramā*) or error results immediately from the conception of true knowledge it consists in having the knowledge of an object as possessed of attributes, which are not in accord with the real nature of the thing, and it is manifold in kind

266, 267, NM, pp 438 ff, TC : 839 ff ; TK, p 6, SP, § 167, CV pp 473, 474, PSPM, pp 19, 20, YS : 11, Raghunātha, PTN, pp. 58, 59, Padartharatnamālā, p 10

¹ NV, p 4

² SP, § 37

The mode of division of error, however is much less matter of agreement than that of knowledge though the principles on which a division can be attempted are simple enough and generally recognized. Thus false knowledge may be deliberately held and believed in man may have a certainty which is yet untrue and his position constitutes error proper (*bhrama*). Or he may merely be lacking in certainty in which case his condition is that of doubt (*saṁśaya*). Or again his ignorance may be real and involuntary arising from causes which he is unable to control or he may deliberately for his own purposes make a false assumption with a view to a *reductio ad absurdum* (*tarka*). Or again there is the peculiar form of error seen in dreams.

In the classification of Praçastapada¹ the division is fourfold possibly not uninfluenced by a desire to make the subdivisions of error correspond in number with those of true knowledge which in his system are also somewhat artificially reckoned as four. They are doubt error indeterminateness and dream. This division which is in essence found in Kanada² is retained as it stands by Jagadīça³ but the other members of the school endeavour to effect a reconciliation between the view of Praçastapada and that of Gautama⁴ with whom doubt and *reductio ad absurdum* form two distinct categories. The most interesting of the attempts to follow Praçastapada is that of Çiva litya⁵ who reduces the subdivisions to two but manages to find a place in them for the others. His classification assumes the two classes of doubt and error in the former he includes conjecture (*uha*) and indeterminateness⁶ as well as *reductio ad absurdum* in the second he includes dreams. Annam

⁶ So NSāra pp 1 2

iruddhananākotī am jñānam) This last definition makes it clear how doubt differs from indeterminate perception which is in reality mere sensation and which therefore lies far behind the stage at which doubt can possibly arise. On the other hand doubt in the precise sense of the word differs from conjecture which Ćivaditya¹ classes under it in the former case if for instance we see at a distance an indeterminate object which we conclude must either be a man or a pole that is doubt if we advance to the stage at which we decide tentatively and without assurance in favour of it being a man conjecture is reached. Indeterminateness which Ćivaditya makes another subdivision of doubt is exemplified by the uncertainty which one may have regarding the precise species of a tree it is therefore a modified and limited form of doubt.

The various causes which can give rise to doubt are variously given by Madhava² Viçvavitha and Keçava Miçra. The most obvious and the stock case is that where the object is seen to possess attributes which are generic in character and therefore may belong to several different things as in the usual example of the object which with outstretched arms or branches seen at a distance may be taken for a tree trunk or a motionless ascetic. The alternatives here it is pointed out are really four the thing may be a man or a tree trunk or some

¹ SP § 164 NSāra pp 1 °

thing which is not a man yet not a tree or something which is not a tree, yet not a man. Or two opinions may be before the subject which he has no means to decide between. Or the object may have qualities too ill defined to secure its recognition. Or on another interpretation even if the object has a specific quality as the earth has odour, yet one who knows that the quality of odour is quite different from the quality of being eternal or the reverse but does not know the position of the earth in this regard may doubt whether or not the earth is eternal or not.

While doubt shares falsity in virtue of the fact that it is the knowledge of an object but only in an indeterminate manner, error is absolutely false as it consists of certainty of the opposite of the truth the object presenting itself with attributes which are repugnant to those which it possesses in reality. Thus error is simply equivalent to false knowledge consisting as it does in perceiving an object differently from what it actually is. Doubt if the doubter decide in favour of the wrong alternative becomes error but that is only when certainty though in the wrong sense has replaced the former doubt. Again error to be such must properly speaking be involuntary due to physical or external causes, apart from the will of him who commits the error. Such are the errors which occur in the case of perception through debilities of the organs or circumstances such as excessive distance or too diminutive size which preclude the due functioning of the means of perception.¹

From error of this type which is involuntary differs entirely the form of error which consists in the *reductio ad absurdum*, and which plays a great part in logic

being dignified by Gautama with the rank of a category.¹ The error involved of course is the false assumption which forms the basis of the reasoning and which essentially differs from real error by reason of its deliberate assumption for the purpose of proving some proposition or of confirming a proof arrived at in some other way. From doubt it differs essentially also in that there must be several alternatives available: the *reductio ad absurdum* is intended to show that something must exist in some determined mode or else some absurd result will be obtained.

The utility and force of the process may be seen at its best in the stock example which seeks to prove the truth of the conclusion that the mountain is fiery because it has smoke.² Where this inference is set out when the propounder of the theory has enunciated the proposition and the reason he proceeds to give the general proposition: "Wherever there is smoke then there is fire." At this point however he may find that his antagonist will not admit the truth of this proposition and denies the universal concomitance of smoke with fire. He then resorts to a *reductio ad absurdum*. He asks his adversary whether the mountain is fiery or not: if the reply is in the affirmative obviously he need not proceed further as his conclusion is proved. If in the negative he proceeds to the proposition: "If the mountain is not fiery then it cannot be smoky." If the adversary will not admit this then he is challenged to produce an instance in which smoke is found in the absence of fire: this he cannot do and therefore must admit the truth of the proposition. Where there is no

¹ 1. 1. 40 NBh pp. 63-70 NV pp. 161-5

206 45

fire there is no smoke From this it follows that as there is no fire on the mountain there can be no smoke a conclusion which manifestly contradicts the truth and drives the adversary to admit his error in opposing the original demonstration In the technical jargon¹ of the schools the procedure of *reductio ad absurdum* appears as the admission of the concomitant (*vyāpaka*) i e in the supposed case the non existence of smoke as a consequence of having admitted that of which it is the concomitant (*vyāpya*) i e the non existence of fire The propriety of classing *reductio ad absurdum* as error lies technically in the conclusion which is reached by the process and which is palpably false The account given by Gautama is simpler *reductio ad absurdum* appears as an investigation regarding an object whose nature is unknown carried on for the purpose of ascertaining that nature and based on the fact that there must be some cause involved As Vatsyayana² explains the process the knowing subject confronted by an object recognizes that it may possess one or other of two contradictory attributes and finally reaches a conclusion based on causality a view which represents the process as it presents itself to one who is seeking to find for himself the truth while the later texts give the process as used in controversy in order to convict an opponent of error

The older Nyaya—not Gautama or his exponents—admits eleven divisions of the general class *tarka* of these the modern school admit only five the last of which *pramanābādhitārthaprasaṅga* is *reductio ad absurdum* as just described the other four are properly forms of logical error they are reasoning in a circle (*cakra*) *regressus ad infinitum* (*anavastha*) dilemma (*anyor yācāya*) and *ignoratio elenchi* (*atmaśāya*)

these and other logical errors whether due to sophistry or incapacity for correct argument, have no real affinity with the process of *reductio ad absurdum* which in effect is a valuable means of proof.

The dream state appears with Praçastapala as the fourth form of false knowledge and Keçava Miçra¹ makes the matter more precise by explaining that in the waking state memory may be true or false but that the dream is always false because we erroneously substitute the idea this for that. In remembrance in fact we recall an object as past. I remember that flower which I saw yesterday. In the dream state which is really memory I fall into the delusion that I actually see this flower which in reality I merely remember before my eyes.²

The exact process of the dream is indicated by Praçastapada³ and Çankara Miçra developing Kanāda's⁴ doctrine that dream arises like remembrance from a previous impression and a special contact between mind and the self. Dream knowledge is the apprehension which arises when the senses have ceased to be active and the mind is quiescent. It is of three kinds: it may be due to the vividness of the impression received in the waking state previous to slumber; it may arise from a disorder of the humours wind bile and phlegm, it may be caused as in the Vedānta view by merit or demerit arousing pleasing or terrifying visions quaint details of which the texts give including among the ill omened the spectacle of one's own marriage. From dream knowledge is distinguished that which inheres in or lies near to sleep or dream (*svapnāntika*)⁵ Praça-

³ pp. 183-184

⁴ i. 2. 7

⁵ i. 2. 8 Chatterj. *Hnd. Rā. sm.* p. 161

śtapada tells us that this is the cognition which springs up in a dream in the form of the recollection of something actually experienced in the dream state. Thus the visions of a dream are accorded power to leave impressions though themselves nothing save impressions of experience—a suggestion which might have evoked the idea that the dream was really the expression of a personality other than that dominant in waking life had not any form of paucyclism been abhorrent to the school. Other interpretations of the phrase were also current: in one view it denotes a prophetic dream in another that dream experience which is felt as actual perception owing to its vivid character.

The dream state is possible only in that form of sleep (*audrā*) in which contact of mind and self is possible though contact between mind and the other sense organs has ceased¹ a condition which Yogins can artificially produce. In deep sleep (*susupti*) all contact of mind and self ceases and the self as in Pīabhakara's view ceases to have consciousness for which mediation by mind is requisite while on the Vedānta view shared by Kumārila it regains its condition of pure consciousness in which of course no dream is possible². The physical possibility of this severance of mind and self rests on the atomic size of the latter and on the view that in deep sleep mind retires to the *pusitat* apparently conceived as a fleshy bag near the heart in which in some unexplained way it is severed from the all pervading self. This grotesque speculation of the school is due as in the Sāṃkhya and Vedānta which have an analogous doctrine to the influence of the *Bṛhadāraṇyaka Upaniṣad* which tells us of the departure of something—the soul according to the Vedānta—into the *pusitat* in sound sleep.

CHAPTER II

PERCEPTION

1 *Normal Perception*

In its widest sense perception includes two things which differ in vital respects, the normal or human perception which is transient and the perception of God which is immediate and eternal and which possesses only so much in common with normal perception that *like it it does not depend on any prior knowledge*. Man however is not totally devoid of a perception which has in it something analogous to that of the deity though unlike that it is transient and conditioned but his normal perception stands on an entirely different basis bringing him into immediate contact with the world of reality. Knowledge which arises from the contact of sense and organ is given by Gautama¹ as the meaning of perception when not subject to error, when not requiring further determination and when definite it reaches the standard of correct knowledge. Vatsyayana² renders more precise the process of perception the self is united with the mind the mind with the sense the sense with the object with the result that perception thus arises. In doing so he definitely brings mind into the position of a quasi sense though in that quality it

¹ 1.1.4 *anyapadeṣam arjūnītau y vasiḥ nalan* for the first epithet see Jacobi JAOS xxxi 20 : 2. The *ecnl* excludes erroneous perception e.g. of water in light of sun rays the third cases of doubt.

² hBh : 1.1.4 NS : 1.1.1 NV pp 40ff

appears neither in Gautama or Kanādā, and the former classes it among the category of objects of knowledge as opposed to instruments of proof. Despite however its connexion with the self and the mind in this manner the proximate cause of perception is the sense or more strictly its contact with the object a distinction which permits the classification of the apprehension of pain or pleasure by the mind as perception while excluding from the category other mental processes such as inference in which mind is active but not as the proximate cause.

The place of mind in the process of perception is established by a series of proofs¹. The self is all pervading consciousness but experience shows that despite the presence of objects of sense and organs of sense frequently perceptions do not result a state of affairs which can be explained only on the assumption that there is requisite something to establish a special contact between the self and the sense organs with their objects. Again the fact that we experience things not all at once but in reality, as analysis shows successively proves the intervention of something between the self and the senses. Mind however, has not merely this function of intervention feelings like pleasure and pain are actually experienced just as much as sensations of colour and smell and it is a fair argument from analogy to assume that there must be for their apprehension an instrument comparable with an organ of sense. The facts of remembrance² point in the same direction if it is argued that feelings thoughts and volitions are directly present in the self it is impossible to explain why they are not always and invariably presented which experience shows not to be the case. Mind, therefore, has a double

¹ VS i 1 16 ii 1 24, iii 2 60-3 VS iii 2 1-3 vii 1 23
 18th Pl 8J 33, TC i 764ff Cf Deussen *Phil. of Up*, pp 273 ff

² VS i 2 20 4V i 9

function to perform, on the one hand it mediates between the senses and the self, on the other hand it plays the part of internal sense and has as its objects the working of the mind. It is interesting to note that feeling and volition are thus ranked on a par with cognitions as the object of internal perception.

Further light is thrown on the definition by the discussion in the Sūtra¹ of the argument that perception is really inference since when we see a tree we really perceive only a part, the rest being supplied by inference the part serving as mark of the whole. This view is rejected, it is pointed out that admittedly there is perception of a part, and that all perception is not inference but it is further maintained that perception of the whole is real and direct and is verified by our ability to hold and pull the tree or other object as a whole. The discussion is then linked to the dispute between Buddhism and the Nyaya on the relation of the whole to its parts the Nyaya maintaining firmly the reality and distinct character of a whole. This passage makes it somewhat difficult to be assured of the correctness of the interpretation of the epithet 'not requiring further determination' in the definition as meaning 'not expressible by words' which Vātsyāyana and Uddyotakara give, other commentators the latter tells us interpreted the phrase as excluding inference and indeed a perception which is to be exempt from confusion of objects and to negative doubt seems almost necessarily to involve expressibility in language.

The interpretation of the Sūtra was early affected by the necessity of bringing it into relation with the important doctrine of Dignāga who from the standpoint of a modified form of idealism, propounded the

¹ II 1 80-6 below ch. vii §

definition of perception as free from determination by imagination (*kalapanāpodha*)¹ which Dharmakīrti improved by adding that it must be correct (*abhranta*)². As will be seen in dealing with his doctrine of inference, as a logician at any rate, Dignaga, followed by Dharmakīrti,³ recognizes a perfectly definite distinction between the parts of sensation and imagination or intellect in perception, the former gives us absolute reality in momentary contact but a perception giving name, substance quality, action or class⁴ is essentially the product of imagination synthesizing momentary impressions, a view obviously very different from that of the Nyaya with its realism since all that is real in the full sense is the momentary sensation, which is absolutely inexpressible. A perception as opposed to a sensation gives the form of the object but that is derived from the intellect not from sensation. The distinction thus drawn between sensation and perception with the allocation to the latter of the work of intellect was not accepted by Uddyotakara⁵ or by Praçastapada,⁶ the argument of the former whose attack on Dignaga is vouched for by Vacaspati being that a consistent sensationalism should be speechless and therefore unable to give the definition suggested

⁷ NVT, p. 10.

or to describe perception as impermanent or a source of pain. If the terms of the definition mean only that the specific individuality of an object is inexpressible that is true since all things have a general and a specific character, and are expressible in the former aspect only, but this gives no real definition of perception.

With *Trilocana*, a predecessor of *Vācaspati* of whom we know little else,¹ there seems to have been introduced into the school interpretation of the Sūtra the view that we must distinguish between two forms of perception, the first of which gives the bare knowledge of the class character of the object and is styled indeterminate (*anirvikalpa*), while the second in place of giving the bare qualification of the object (*viśeṣaṇa*) gives the determinate (*savikalpa*) relation of qualified (*viśeṣya*) and qualification whether the latter be strictly so called or something essentially coexistent with the thing qualified or an accident (*upalakṣaṇa*). The Sūtra must it is held, refer to both the latter depending on the former, which is inexpressible in words, like the cognition of children or those who do not know the correct term for a new experience, and therefore the first is understood by *avyapadeśya*, while the second by *vyavahayatmaka*. This doctrine reappears in a classical form in Gaṅgeṣa² who insists that the existence of this abstract or indeterminate perception is known by inference, since, unless it is postulated there is an infinite regress, and we must therefore accept as final a direct perception of the class (substance quality or action), which, however, always becomes concrete by application to the thing perceived, the two forms therefore not constituting distinct species,

¹ See *Vācaspati* on 1.1.4. He is cited also on other points in TR pp. 337, 356 (before *Vācaspati*), cf. on the Sūtra, pp. 63-64.

² TC, I 809 ff., so TR, p. 64, NM p. 97 ff., TB, I 8, NSM pp. 13-14. cf. *Padārthanirṇaya* sūtra, pp. 6, 7.

on the determinate perception follows the reference to self in the *apū rya asayī*. At the same time the definition of perception is revised to run: a cognition which is not brought about by another cognition—a definition¹ intended to meet the objection that the old definition really covered every cognition since organ was interpreted to include mind—that it omitted the divine cognition and introduced the term organ whose extent could be decided only by perception itself. The new definition excludes inference which depends on the perception of the invariable concomitance of the middle and major and of the presence of the middle in the minor—analogy which rests on cognition of similarity—and verbal testimony resting on cognition of the meaning of words—a fact which also explains the primacy given to perception as a means of proof by the Sutra.²

Another point of view however appears in Kumarila the *Ayazara*³ and in recent Nyaya⁴ doctrine. The Buddhist doctrine of the peculiarity (*svadīkṣa*) of the object in indeterminate perception was met on the one hand by the assertion of the Ābhidhikāś that it was the bare name which was thus apprehended while others—the Vedānta held that it was existence in its abstract form (*sat*)—views which Jāyanta rejects. Kumarila held that sensation set up a condition due to the thing in itself (*guḍhaśloka*) of observation like that of a new born child on perceiving reality in which generality and

¹ TC. 1. 50. Mathuranātha (l. 602) explains this as not inconsistent with Cōd. being regarded as the final cause of all knowledge.

⁷ VM. 11. ff.

particularity are latent and which only later developed into determinate cognition and the *Nyayasāstra* makes it clear that indeterminate perception gives only the mere existence (*vastusvarupa mātra*) of the object in the recognition that an undefined something exists on which determinate perception is built up. But unlike Gūṇgeṣa the indeterminate form is no mere inference unobserved in practice it can be seen in any case of the acquisition of new knowledge. The latest development of this view definitely severs indeterminate perception from all other forms of apprehension at the root of which it lies, and thus approaches the psychological conception of sensation as opposed to perception.¹

The validity of determinate perception is naturally assailed by the Buddhists, who deny that perception can give connexion of an object with a name, or that there is any generality which can be predicated of an individual thing, which is momentary in character. The Nyaya with Kumārila refuses to accept these contentions, generality is directly perceived when an individual is apprehended, and can therefore be predicated of the individual, as in Aristotle being is predicable of the individual despite its unique character. The giving of a name is certainly not derived from perception and a perfectly clear perception is possible, e.g. of musical notes, though we cannot name what we see whether from ignorance or forgetfulness. But the name can be supplied either on or after perception from memory or instruction, the giving of names is necessary for communication of knowledge and memory, but it is not in itself a source of error. Nor is perception merely due

¹ *Nāṭakānta*, on TSD 1 c., Athalye, TS., pp. 219, 220.

³ Cf. Arist., *de Interpret.*, 16 a 19.

to the activity of memory, in our perception of any individual thing much is due to that source but its distinct individuality and time relation are directly due to perception

2 *The Forms of Perception and their Objects*

The organs of perception are six in number five external those of seeing hearing tasting smelling and touching (a term which includes the temperature sense) and one internal mind and there are various ways in which the contact between the organ and the object which is the prerequisite of perception can take place¹ These are conjunction (*samyoga*) inherence in that which is in conjunction (*samīyukta samavāya*) inherence in that which inheres in that which is in conjunction (*samīyukta samaveta samavāya*) inherence (*samavāya*) inherence in that which inheres (*samaveta samavāya*), and relation of predicate and subject (*viśeṣa viśeṣyuta*) and all that is the object of perception must fall within one or other of these modes of contact. The divergence of modes rests on ontological theories the eye for instance as a substance can come into direct conjunction with another substance but only indirectly with e.g. colour which inheres in that substance and at a further remove with the class concept which inheres in the colour which inheres in the object with which the eye is in conjunction. The ear again is a portion of the ether and sound inheres in it and therefore is apprehended by the relation of inherence, while its class concept by the relation of inherence in that which inheres. The last class is intended to meet the special case of the perception of inherence and negation

¹ Cf. VS vii 13 II. NV i 14 TC i 52 ff. TA p 10 TB pp 28-30. TA pp 89 TS § 43 BP 59 61 NSr ii 23
 150 \$DST i 17 NSM i p 6-31

Among the objects of perception the qualities of the self such as cognition pleasure and pain are perceived by the mind and the later Nyaya includes the self itself in that category, while the Vaiśeṣika accepts the doctrine that the self is only an object of inference¹ Of the other objects, it is agreed that a substance having magnitude can be perceived by sight provided, however that it has a manifest colour² the form of contact is literal conjunction the object and the eye being deemed to come into actual effective contact The modern school admits also the power of touch to perceive substance, provided that the substance has in it the quality of touch while Viśvanatha by an unhappy attempt at a compromise between the views makes the power of touch to discern substance conditional on the substance having manifest colour Quality and motion³ again are perceived by the organs by means of the second form of contact inherence in that which is in conjunction Generally the fourth of the Vaiśeṣika categories is perceived by the second or the third of the forms of contact according as the generality is that of substance or of a quality or action Particularity, which resides in the atoms is necessarily immune from normal perception

There remain the categories of inherence and non existence both of which the Nyaya holds to be perceptible while the Vaiśeṣika restricts this power to

¹ II 1 2 2 1b viii 1 2 VS. ra p 86 TR, pp 119 120 NBh., p. 10 gives direct vision to Yogas only below ch ix § 1

² VS iv 1 6, below ch vii § 2 ch viii § 9 Light therefore is necessary for visual perception but as affecting the object, not the organ

³ Prabhākara denies perception PP., pp. 78-79 Kumārila accepts it QD, p. 50 Deussen's denial (*Allge. Gesch.*, I iii 809) that substance is perceived is an error sight touch and mind see substance VSM pp 2nd ff For the modern doctrine of the sensation of movement, cf Wildon Carr, *Proc. Ar. et Soc.* 1915 16

non existence and asserts that inherence is a matter of inference. In either case the contact of predicate and subject is held to apply a view based on the fact that inherence and non-existence having no autonomous existence can be perceived only as attributes of some object in which they are found. In the case of inherence the conception which is confined to the strict Njaya view¹ is at least simple but the case of non existence² presents obvious difficulties. As it is not a substance it cannot be known by conjunction as it is not a quality, activity or class it cannot inhere in a substance and therefore can be perceived only by its relation to that in which it does not exist. The perception of the non existence of a pot on the ground involves accordingly first a contact between the eye and the ground and secondly a peculiar contact between the ground and the absence of the pot. This contact may be expressed in two forms either as 'The ground is possessed of the absence of a pot' (*gl atāḥarav l bhutalam*) the ground serving as the subject and the absence of the pot as the qualification or as 'There is the absence of a pot on the ground' (*bhū tale gl atāḥaro sta*), in which case the relations are reversed. Thus the sixth form of contact consists of two distinct kinds corresponding to the divergence in the form of proposition. In the first case the negation forms the qualification of that which is in contact (*saṁ yukta vicesaṁ atī*) namely the ground with the eye. In the second case the negation is to be qualified by that which is in contact (*saṁ yukta vicesata*). In

the case of perception of a substance like a pot however there can be no such duality of form of contact, a pot we see in itself but the non existence of a pot can be perceived only in virtue of its relation to the ground and it is in the double form of relation which is possible between the pot and the ground that there lies the reason for the double form of contact possible

Non existence however is not applicable to substance only¹ the last form of contact, though it primarily refers to substance is available to be brought into operation in cases where the positive element is established by any of the other modes of contact thus the non existence of a quality is established by a variety of the relation of subject and predicate applied to the second form of contact and so on

This peculiar mode of contact assumed by the Nyaya is, not unnaturally rejected by the Mimamsa which however agrees with the Nyaya in the view that non existence is the object of direct apprehension Contact between an organ and non existence is impossible it is argued because contact must be either conjunction or inherence. Conjunction is possible only between two substances and non-existence is not a substance Inherence signifies inseparable connexion and no one can assert that of an organ and non existence Moreover these conceptions have validity only for the world of existence and should not be applied outside that sphere They assert therefore non perception (*anupalabdhi*) is a special independent means of proof a view which the Nyaya rejects² In doing so however it is compelled

¹ As Raghunatha (PTN p 49) holds. He also (pp 76-8) claims that *abhya* is a special category Cf also *Pañcārthīratnam* I pp 7-8.

² TC I 6th 92 TB pp. 52-5 TK pp 17, 18 TSQ § 43 K 14 fil 20 2 NS 1, pp 33 34, 241 6 TR p 10th 16 PSPM, pp 7th 73, NSM, pp. 34-58 *cf* fra CV, pp 243 5th CD p 60 0 KKK 1 355 64 ridicules the Nyaya view

to make concessions and to admit that non perception is an accessory cause of the result. The mere vision of the ground does not suggest the absence of a pot. it can do so only when there was reason on other grounds to expect the presence there of a pot and, when this expectation is defeated by our failure to see the pot the basis is laid for the peculiar contact which in the Nyaya view is the cause of the perception of non existence. But the Nyaya is careful to emphasize that non perception even as a subsidiary means must be restricted to cases where perception is possible. thus the merit and demerit of good and evil actions is real in every sense but it is not open to perception and failure to perceive it is no ground for asserting that it does not exist. The controversy with the Mimamsa thus reduces itself largely to a point of form the Nyaya admitting non perception as a subsidiary while the Mimamsa insists that it is the primary, cause of the perception of non existence and that it has the distinctive character of differing from perception inference or other proof.

Other difficulties regarding perception are raised and solved in the *Nyaya Sutra*. An interesting suggestion of Dignaga that material contact is not the cause of vision is put forward supported by the possibility of distant vision and of the eye seeing things larger and smaller than itself. The reply is that contact is effected by a ray from the eye which as possessing neither magnitude nor colour is invisible. it is not merely overpowered by light for it does not shine in the dark though the ray in the eyes of cats suggests its presence in ours also. The obstructions met by sense prove also materiality, if glass mica crystal do not prevent vision it is simply because they are transparent. a wall does prevent it.¹ If contact, however is necessary, it is

¹ NS. in 1 30-50 of Kir pp 74-6 NK p. 93 NV pp 35-8

natural to suggest that there is but one sense organ the skin¹ and that all other senses are mere modifications of it. This however is contrary to the fact that objects are not perceived simultaneously which argues a difference in their apprehension. Or again if from the fact that all things perceived by sense have the common quality of being an object it is argued that sense also is one this view can be met by pointing to the different character of cognition in each of the five cases the different location of the organ the different process of its action the different form of the organ and its divergent constitution from atoms. Eye nose tongue and skin are composed of atoms of fire earth water and air while the ear is a portion of the ether and these elements have the characteristic qualities of colour odour savour tangibility and sound. It is true that all save air and ether possess more than one quality but one predominates both in the atom and in the sense composed of atoms² so that each sense apprehends one quality. On the other hand no more than five senses are needed for a separate sense is not required for the apprehension of distinctions within a genus³. Though the senses thus possess qualities they themselves are invisible and their qualities must therefore exist in a latent state⁴ as must be the case if they are to perform their allotted function a conception which has a remote affinity with the Aristotelian doctrine of sense as a

The rapidity of the ray prevents the observation of its successive action. Its conjunction with points of space explains our sense of distance. Cf. KKK. i. 111 SS v. 101.8. Dignāga is quoted Padārtha-rasānā p. 21-22.

potentiality just as the doctrine of mind may be compared with that of the *sensus communis*. The organ is thus the place of contact between mind and the self: its existence unlike that of external things is proved like that of mind by inference alone every agent requiring to work by means of an instrument. The ear however stands in a special position as it actually is part of ether¹ and possesses sound as a quality. Hence in the perception of negation in the case of sound what is perceived is not as e.g. in the case of the negation of a jar a qualification of an object e.g. earth but of the organ of sense itself.²

*Keçava Miçra*³ is responsible for an effort to make precise the instrumentality of sense and the contact with an object in producing indeterminate and determinate perception respectively. Sense is the proximate cause (*karana*) by its activity (*vyapara*) contact gives indeterminate perception, contact as cause with indeterminate perception as activity gives determinate perception. In determinate perception with determinate gives desire. But this refinement is not generally accepted.

3 *Transcendental Perception*

Normal perception as described is essentially based on sensation and there is therefore in it a substantial basis for the contention that the Nyaya Vaiśeṣika system is comparable to the sensationalism of Locke⁴. It is true moreover that in its origin the doctrine was frankly accepted in its fullest extent by both schools: the Nyaya expressly lays down that inference depends on percep-

¹ This is denied by Kumārila CV pp 418-21 of TC 1 617 ff PSPM pp 60-61 below, cf vi § 3.

² TC 1 574 ff NSM p 35

³ p 93

⁴ cf also TS pp 231-232 Jacobs NQWQ 1901 p 461

tion and the same conclusion obviously follows for such knowledge as is obtainable by comparison. But it must not be forgotten that verbal knowledge in the Nyaya conception extended beyond this limit and Praçastapada accords decisive weight to the tradition handed down in the works of his master Kanada neither view being in harmony with a pure sensationalism and in perception we know generality as well as particularity.

The growing care with which the mechanism of proof was studied resulted as was inevitable, in the definite attempt to provide a place for the ideal element which was plainly somewhat lacking in the older theory of perception. It was realized that to establish a universal proposition by mere empiric means was impossible no summing of individual perceptions would give any assurance of legitimacy of reasoning. In the syncretist school in Laugakṣi Bhaskara¹ and in Viçvanatha² we find fully developed the conception of a supernormal or transcendental perception (*alaukika pratyakṣa*) which manifests itself in three different forms. The first whose characteristic is generality (*samanya-lakṣana*), is the knowledge which we possess from seeing an individual thing of the class to which it belongs and of all the individuals of that class not however, as individuals but as making up the class. This form of perception cannot be explained by any normal form of contact, it is to be interpreted as due to a connexion (*pratyasatti*) between the mind and generality *sui generis*. A second form whose characteristic is knowledge (*jñāna lakṣana*) is exemplified in the action of the mind which when we for example perceive a flower brings before us the

¹ TK p 9 of VSV ix. 1 11 TSD p 45

² BP 62 6 for Gaṅgeśa's view see TC ii 233 ff. NSM pp 23 ff
Its place in inference is fully recognized in Kumarila CV pp 201-7
AB, p 163

conception of fragrance as pertaining to it, though the flower itself is at such a distance that we have no possibility of actually experiencing the odour. The process demands, therefore, that we should already have framed for ourselves the connexion of the generic relation of odour and flower, which on the perception of the flower enables us to assert its odour, the process which lies at the root of inference. Under the same head fall the products of the creative imagination of the poet or thinker, and even such cognitions as deal with knowledge of the supersensible as 'I know an atom' ¹

While these two forms of supernormal knowledge stand in close relation and represent fundamental realities the third, born of ascetic power (*yoga ja*) ² is peculiar to the system, and derives its existence from its acceptance of the power of seers to perceive in an intuitive vision the whole of truth. The exact cause of this power is asserted to be the contact of mind and the merit which the ascetic has acquired. In the complete ascetic the perception is ever present in its perfection, at a lower stage of merit it requires concentration of mind to achieve it.

Of these three forms it is clear that the first has close affinities with the simpler early doctrine that every sense can perceive directly generality by the use of the second and third forms of normal contact according as the generality is that of a substance or quality or activity. The modern school however has advanced beyond this doctrine by insisting on the peculiarity of

¹ VVTP, commentary pp 166, 169-161 cf *Padartharatnamālā*, pp. 6-8, where God's perception appears as one distinct class.

² VS ix 1 11, 12 Hence ĀSara, pp 2-4 with a division into determinate and indeterminate applicable to the lower form (*ayukta, rasaka*), and the indeterminate only in the *śālikasāhā*, see ch ix § 2 Cf SS. i 90-91 TR pp 59-60 with commentary NBh, p. 10, ÇV p 72, PBh p. 72 has āra Cf KKK i 20 NK p 19

the form of contact and accentuating the part played by mind, which in the first form of supernormal knowledge frames the general concept and in the second is responsible for the association of ideas which constitutes it. There need be little hesitation to ascribe to the influence of Buddhist logic with its insistence on the part of imagination in the framing of ideas the growing appreciation in the Nyaya-Vaiśeṣika of the active part played by mind in the development of knowledge.

The conception of the perception enjoyed by ascetics is also found in Dignaga and Dharmakīrti¹ who provides for four classes of perception—sense perception mental perception, self consciousness and the perception of ascetics. The second and third classes in his division fall into the sphere of activity of mind in perception in the Nyaya-Vaiśeṣika theory. Dharmottara² adds that the perception of ascetics is essentially indeterminate.

CHAPTER III

INFERENCE AND COMPARISON

1 *The Development of the Doctrine of Inference and Syllogism.*

THOUGH Gautama stands at the head of the school of Nyaya on the essential doctrine which is normally associated with logical inquiries he has extremely little to tell us but his testimony is the more valuable in that it shows the gradual development from mere dialectics to logic. Vatsyayana stands on the same level as his master in his exposition of the process of reasoning as described by Gautama¹ he asserts that the process of reasoning is extremely subtle hard to understand and only to be mastered by one of much learning and ability. The admission is important as it makes it easy to realize how difficult were found the first steps to understand the real nature of logical reasoning even when the formal procedure was well established as it was in Gautama's time.

Gautama lays down that there are five members (*avayava*) of a syllogism namely the proposition (*pratiyoga*) the reason (*hetu*) the example (*udaharana*) the application (*upanaya*) and the conclusion (*nigamana*). But Vatsyayana reveals that others raised the number of members of the syllogism to ten and it is probable enough that this represents a view prevalent before Gautama and that his contribution to the de-

velopment of the topic included the removal of these members which in the conclusion have, as his commentator observes, no just place but play a part in the discussion of a topic. These are the desire to know (*jñāna*) the doubt (*saṃśaya*) the belief in the possibility of a solution (*śakyaprapñ*) the purpose in view in attaining the conclusion (*prayojana*) and the removal of doubt (*saṃśaya vyūḍhasa*). With its full ten members¹ we have before us in miniature the course of the kind of discussion which preceded the development of formal investigation of the logical process and we can recognize the substantial improvement involved in omitting all that did not directly bear on the attainment of the conclusion.

In the later logic of the schools the scheme of Gautama is illustrated by the formal syllogism

The hill is fiery

Because it has smoke

Whatever is smoky is fiery like a kitchen

So is this hill (smoky)

Therefore is the hill fiery

The argument therefore rests on a general assertion of the concomitance (*vyapti*) which exists between smoke and fire. But can this generalization be attributed to Gautama himself? The answer must assuredly be in the negative. The only principle laid down by Gautama is as follows². The reason proves what is to be established through its similarity with the example not through dissimilarity. The example has the characteristics of the thing because of its similarity with it or has not the characteristics, because of dissimilarity.

¹ Cf. Bhadrabāhu's 10 member argument for Jānami. *Med. Log.* pp. 6 ff. which however is very different.

² 1. 1. 34. 6. Athalye TS. p. 9. Jacob. *AGWG* 1901 pp. 459-477. Gāṅgādhara Jīva NS. 1. 385 n. NEh. pp. 40-43.

It is impossible to resist the conclusion that the third member of the syllogism is nothing more than an example, and that the original process knew no formulation of a general rule. This conclusion is supported not merely by the fact that the term example is only with great difficulty to be reconciled with a real general proposition but by the form of the syllogism in its fourth and fifth members which run in the original

Thus is this (*tatha cayam*) Therefore thus (is it) (*tasmat tatha*) The summing up in the application is expressly said by Gautama to be dependent on the example and this is entirely borne out by the word thus which can only be referred to the word as in the example 'as a kitchen (*yatha mahanasah*) as the example originally ran'.¹ Similarly the thus in the fifth member of the syllogism is only to be explained as a reference to the is of the third. In both cases however if the third member had the full form which it possesses in the later system the reference would be unintelligible. With this conclusion accords perfectly the literary use of the syllogism the last two members are not used and the third appears merely in the reduced form of the example while in Vatsyayana where if it had existed the general proposition would have been expected to appear it is never found although he frames many syllogisms especially in *Ahnika* I of Book V in his commentary the most that he does is to adopt the form. It is observed that the kitchen has smoke and also has fire. The fact that reasoning can only be by means of a general proposition had thus not yet been appreciated in the school for this reasoning still was from particular to particular by analogy in the manner approved by J. S. Mill. The origin of the syllogistic

¹ Originally presumably *t. kayam*

form can then be recognized as arising from the effort to expound a proposition to another the proposition is stated, the reason for it is asked, the ground is given, its validity is called in question, an example familiar and therefore cogent is adduced and the similarity of the subject to the example is emphasized and the conclusion is finally drawn. It is characteristic of the conservatism of the schools that the scheme was retained long after it had ceased to be the real form of the reasoning employed.

The other important contribution by Gautama to the theory of the syllogism is contained in the solitary aphorism¹ devoted to the conclusion which thus fares badly compared with the members of the syllogism to which eight aphorisms are devoted while fallacious reasons have six. There inference is declared to be dependent on perception (*lat purvakam*) and to be of three kinds—*puravat*, *śeśat* and *samanyato dīṣṭam*. These phrases are in themselves hopelessly obscure, and Vatsyānaṇ gives two explanations of fundamentally different character, a fact which may be interpreted either as indicating that even before Gautama there were different views prevalent in the school, or that there intervened a considerable interval between Gautama and his follower during which conflicting interpretations of his aphorisms had come into vogue. According to the first of these interpretations inference *puravat* 'as formerly', is inference from cause to effect thus from the sight of clouds it is inferred that rain will fall. Inference *śeśat* is from effect to cause as when from the swelling river it is inferred that rain has fallen.

¹ 1. 1. 5. Other views are given by Vācaspati and by Uddyotakara, *l. c.*, who prefers the idea that it is inference from something commonly seen, e.g. water from the presence of cranes, cf. SBH viii 3. The reading '*dīṣṭam*' is impossible.

Inference *samanyato dr̥ṣṭa* is illustrated by such a case, differing from the two previous as that in which from observing the different positions assumed in the course of the day by the sun we conclude by analogy of ordinary motion that it moves although such motion is not open to our perception. The second explanation offered by Vatsyayana makes *pūrvavat* an inference based on previous experience of the concomitance between two things, such as smoke and fire which we still therefore accept later on when we no longer have the actual perception of the concomitance before our eyes. *Śeṣavat* is proof by elimination thus sound can be proved to be a quality by showing that it must be either a substance, quality, or activity, and that it can be neither the first nor the last, and therefore must be the second. *Samanyato dr̥ṣṭa* is an inference in which the relation between the reason and the consequence not being a matter of perception, something which is not perceptible is proved to exist by virtue of the abstract similarity with something else of the reason a definition which is rendered more intelligible by the instance adduced which shows that the self or soul is proved to exist by the fact that desire &c are qualities and that qualities must abide in some substance namely, the self.

It is doubtful whether either of these theories has any claim to represent the true state of affairs, for in an obscure aphorism in a later part of his work¹ Gautama refers to objections to inference based on the fact that it sometimes misleads thus to the argument that if we see a river swollen we infer that there has been rain may be objected that the cause may be an embankment.

¹ B. I. 3rd 23. Jacobi NGWC 1901 p. 478. XII pp. 86 87. NY pp. 2 3-5. The answer in 1st on the specific character of the facts on which inference is based.

to the argument that, if we see ants carrying off their eggs we infer there will be rain may be objected that the real cause is that some one has damaged their nest while, if we infer from the scream of a peacock the coming of rain we may really be hearing a human cry, from which no such inference can be drawn. It can scarcely be denied that the three instances given must be deemed to correspond with the three forms of inference previously defined, and in that case it is clear that to Gautama inference *puravat* is from the later to the earlier from the effect to the cause, and that *vice versa* inference *śesavat* is from the earlier to the later but the precise sense of *samānyato dīṣṭa* must remain obscure perhaps denoting similarity as a basis of inference. It is difficult to doubt however, especially in view of the tradition and the use of the phrase later though in a different context by Praçastapāda that the term applied to some abstract form of reasoning in which perception could not directly be applied.

This conclusion receives reinforcement from the further development given to the scheme at some later period for which we have the solitary testimony of Vacaspati Miśra in his exposition of the Sāṃkhya system¹. The decisive advance made is that the three forms are reduced to two classes the first of these styled direct (*ūṣṭa*) comprises *puravat* and *samānyato dīṣṭa*, the second styled indirect (*avīṣṭa*) is comprised by *śesavat*. The latter is a means of proof by elimination, and is used to establish for example the Sāṃkhya doctrine of the pre-existence of the effect in the cause, the clay and the pot are one, because neither the relation of union or separation between them is possible, for, if they were different, then they must either be in a relation

¹ Burck *VOI* xv 251-61, cf. the use of *śūla* and *avīṣṭa* in *NV*, p. 126, *Vijñānabhikṣu*, SS i 103.

of union like the pot and its contents, or in one of separation, like two mountains, neither of these conditions is the case—therefore clay and pot are one¹. In the same way the existence of the soul is established by the argument that if it did not exist there would be no self-consciousness which is manifestly contrary to fact. Between the two forms of direct proof the difference consists in the nature of the knowledge which results, not in the process itself. In *purvavat* that knowledge is concerned with a general principle which is perceptible, in *samanyato dr̥ṣṭa* the peculiar nature of the knowledge involved lies in the fact that the general relation exists, but is not open to perception (*adr̥ṣṭavalakṣaṇa samānya* as opposed to *dr̥ṣṭavalakṣaṇa samānya*)². The form of inference *purvavat* is of minor importance to a system which is concerned with higher things than those of sense: the other form of direct proof is invaluable to establish such things as the existence of the soul. All that has the characteristics of joy, sorrow and confusion it is argued, is guided by another like a chariot by the driver, all the world has these characteristics—therefore all the world has a ruler. Or, again thus we can prove that the perception of colour requires sight, perception of colour requires an instrument namely sight, for it is an activity, every activity requires an instrument, as felling trees requires an axe, perception of colour is an activity, therefore perception of colour requires an instrument. The skilled use made of the arguments is obvious, but it must remain doubtful to what school is to be ascribed the adaption to this end of the older division of the Nyaya. It is plain that it existed before Vācaspati Miśra, and it may be³ that it was devised by some member of the Nyaya before it was

¹ Cf. N.Y., p. 234, which favours the early use of the argument.

² Cf. PSPM, pp. 47, 48.

³ Contra Vācaspati on L. I. 35.

adopted by some adherent of the *Samkhya*. The failure of the doctrine to become accepted in either school is clearly remarkable, for it plainly offered a convenient means for giving effect to the traditional theory more explicitly than was done by the contending view of its significance. But, of course, it would be a mistake to seek to find in it the parallel of the distinction between induction and deduction in the terminology of formal logic¹ the character of the reasoning corresponds strictly neither to deduction or induction, and the distinction between these two forms, in itself of no ultimate importance, is not reproduced in any form of the Indian doctrine. To Gautama it is clear the distinction could not possibly have occurred, content as he was with reasoning by analogy from particular instances.

The terminology of Gautama and of Vatsyayana naturally reflects the stage of their researches. The normal terms of the later logic, *pāśa*, *pāśādharmata*, *vyūpti*, *anvaya*, *vyatireka*, and *paramarśa*, are unknown to the *Sūtra* and the term *sādhyā*,² which later denotes the conclusion to be proved of the subject has the not unnatural sense of the subject itself as that of which an attribute is to be established.

If the early Nyaya school had made little progress in the scientific examination of its subject, it is not surprising that Kanada, whose interest was essentially in reality, has little to add to the doctrine of inference. The fact that he mentions in the chief passage in which he touches on the matter the technical term *anvaya*,³ which denotes a member of the syllogism, and in the

³ ix 2 1, 2, cf. iii 1 1-14.

context has the meaning example, is a clear indication that he contemplated logical doctrine much as it stands in Gautama. His own interest is devoted to a statement of the real relations which afford the basis of the logical relation between reason and consequent. They are enumerated as cause and effect conjunction, opposition and inference. Inference can be from the effect to the cause or *vice versa*.

2 *Pracastapada and Dignaga*

In Pracastapada's exposition¹ of Kanada's doctrine of inference an advance of first rate importance is made. The attempt at an exhaustive enumeration of real relations as a basis for inference is abandoned in favour of the wider conception of concomitance (*sahacarya* in his terminology, as opposed to the later *vyapti*) between the ground (*sahacarita*, *atimābhūta*, later *vyapta* or *vyapya*) and the consequence. He does not however admit that this is an innovation, he claims that Kanāda's list of real relations is not intended to be complete but illustrative, every form of relation being meant to be included. His own doctrine is simple², if anything is indissolubly connected with another in time or space it is legitimate for us finding ourselves confronted with one of the two to conclude the existence of the other also. The affirmative judgement is therefore analysed as follows: 'a man first takes cognizance of the connexion of fire and smoke expressed in the propositions: Where there is smoke then there is fire, in the absence of fire there is no smoke', and when he sees smoke so as to have no doubt of its existence, he proceeds to conclude the presence of

¹ Jacobi *AGWG* 1901 pp 479 ff. *Stcherbatsko Museum* v 133 ff.

² p. 205 of Kumāra's *Çā* pp 202 ff. *Nāra* p. 5 *Samyagdarśana* *Śāstra* *pariśiṣṭa* *śūlārasādhanaṁ anuśāsanam* *ISPML*, pp 43 ff.

fire. There is no departure from the realism of Kanada but the precise list of real relations which he expounded has proved to be too limited to meet all needs and a more general relationship has been propounded which covers such cases as the appearance of one set of lunar mansions at the setting of the other, or the inference of the presence of water from the sight of cranes.

In close connexion with the new conception stands the account given by Praçastapāda of the conditions for the validity of the reason or middle term as a means of proof. In his account he cites¹ as a view of Kaçyapa the rule that 'that middle term is capable of producing a correct conclusion which is connected with the major, present in similar cases, and absent in dissimilar cases', a classification on which a theory of fallacies is based. This theory goes it is certain far beyond Kanada who knows two kinds of fallacy only but later tradition assumes that Kaçyapa² is a reference to Kanāda by his family name and it may be regarded as proved that Praçastapāda intends us to accept the view set out as Kanada's. What remains doubtful is whether in this he is deliberately attributing to the Sutra a view, which he desired to read into it or whether the process of change dates from before his time. It is a point in favour of the latter theory that he himself puts forward four classes of fallacy but this is not of decisive weight. It is of importance however that concomitantly with the doctrine of defects of the middle appears one of defects of thesis and conclusion a treatment which is almost peculiar in the school to Praçastapāda.

A further important innovation is the appearance of the distinction wholly unknown to Gautama and Kanada of the process of inference for one self (*sviniç*

¹ p. 200.

² Cf. TR. p. 144

citārtha) and for another (*parārtha*) The distinction is one which is accepted by the syncretist school though not adopted by commentators on the Nyāya like Uddyotakara and Vacaspati Miśra, who remain faithful to the texts they explain It is clear that for him the inference for oneself was the only true form of inference after defining it he proceeds to show that the other means of proof beside perception and inference allowed by the Nyāya and Mīmāṃsā schools have no claim to separate rank and can be included in inference This form of inference he divides into two classes¹ in contradistinction from the three which the Nyāya set up namely *dīṣṭa* and *sāmānyato dr̥ṣṭa* The former is the form of inference when the middle term and conclusion are not heterogeneous, the latter is the form when they are heterogeneous, and the result depends on an idea common to the reason and the conclusion The distinction, though far from clearly expressed is evidently between matters of inference which fall under the sphere of sense perception and those which escape that test, and therefore must rest on abstract reasoning The definite acceptance of this doctrine by the Vaiśeṣika stands in harmony with the acceptance in place of the crude realism of Kanāda of the wider idea of logical connexion, with a more vaguely conceived physical counterpart

The inference for another is definitely identified with the five member syllogism, which in Gautama forms a category, and is not classified formally as a means of proof though inference itself is so classed The names

¹ p. 205, so NSāra, pp. 5, 93 ff.

² Jacobi (VSWG 1901, p. 451) and Suali (*Int.*, p. 417) render *prasiddhasiddhāntyoh* as referring to the subject and example but this is contrary to the analogy of *sāmānyato dr̥ṣṭa* in the Nyāya cf. *apratyakṣeḥ agalāṅginoh sambandhe* NBh., p. 14 cf. CV p. 195, vv. 92-93 in pp. 201 ff. the double division is discussed TR pp. 81-82 PSM, pp. 47, 48

of the five members, however, differ from those given in the Nyaya school. They appear as *pratiyñā apadeṣa nidaṣaṇa*, *upasandhana* and *pratyāmnaya* the first alone therefore coinciding with the Nyāya names. It is not probable that the new terms were the invention of Praçastapada: the second the name for the reason is given by Kanada¹ himself. The different terminology may be interpreted as denoting some measure of independence of the Nyaya in the development of logic in the Vaiṣeṣika school but too much stress cannot be laid on this conclusion, the influence of the Nyaya is plain on Praçastapada, he divides the example into the two cases of similarity and dissimilarity² which precisely reproduces the older division of the Nyaya and follows its precise terminology. But the treatment shows one great distinction which is the inevitable result of the new conception of invariable concomitance. In the third member of the syllogism the principle is expressly set out and the example sinks to the level of an illustration though not until the last days of the schools was the further step taken and the example omitted as superfluous.

With these changes the whole system of the Nyaya appears transformed, what was a mere technical discipline has been changed into a deliberate effort to formulate the principles involved in inference and the result achieved is largely adhered to by the following authors of both schools. As yet however the terminology of Praçastapada differs largely from the later norm nothing shows this more clearly than his avoidance³ of the terms *vyapti*, *vyāptaka* and *vyāpna*, or *pakṣa*, *īpakṣa* and

¹ III 1 14

accuracy his tenets. Some of his precise arguments are also given in Uddyotakara's commentary, the attribution to Dignaga being vouched for by Vācaspati Miśra so that it is possible to form a definite view of his contributions to logical theory.

The date of Dignaga is obviously of the greatest importance for this question but it is involved in obscurity. The tradition of his life preserved in the Tibetan Lama Taranatha's *History of Buddhism* ascribes his place of birth to Kaśī now Conjeeveram in the Madras Presidency and makes him the son of a Brahman. Taught by Nāgadatta of the Vātsīputriya sect he became expert in the doctrines of the Hinayana school of Buddhism but later acquired from his teacher Vasubandhu the brother of Asanga knowledge of the doctrines of the Mahayana school and in special of the idealism (*Vijñānavāda*) of which Asanga and Vasubandhu were the leading representatives. He defeated his opponents in disputes at Nalanda travelled widely in Mahārāstra and Orissa and finally died in the latter country. If the record has any claim to truth it enables us to assign to Dignaga a date shortly after the *floruit* of his teachers and in fact on the strength of arguments which seem to make A.D. 480 a plausible date for Vasubandhu. Dignaga has often been assigned to the early part of the sixth century A.D.¹ This view however can hardly now be maintained for there are strong reasons to suppose that Vasubandhu can more safely be dated in the first half of the fourth century A.D.² so that Dignaga may have flourished before A.D. 400. A famous verse of the *Meghadūta*³ has been interpreted by the ingenuity

³ l. 14.

of commentators as a reference to the logicians's heavy hand and if the tradition is accepted it would tend to confirm the date suggested for Dignaga, since Kaṇḍāsa is more probably to be dated at the end of the fourth than of the fifth century. But there is no cogent ground for accepting the tradition. It is however, clear that, so far as chronological grounds go there is nothing to prevent the supposition that Praçastapāda was indebted for his system largely to Dignaga whose fame is attested not merely by the attacks of the Nyaya school but by the onslaught of Kumārila Bhaṭṭa the famous Mīmāṃsist, and his commentator Pārthasaṁṭhi Miçra and the criticisms of Jain writers like Prabhacandra and Vidyānātha.

The *Pramāṇasamuccaya* in his treatment of topics already presents a close similarity to Praçastapāda. It is divided into six chapters, the first dealing with perception, the second with inference for oneself, the third with inference for another, the fourth with the three characteristics of the reason or middle term and the claim of comparison to be a separate means of proof which is disallowed, in the fifth verbal testimony is similarly rejected, and in the last the parts of a syllogism are treated of. The *Hetucakrahamaṇu* contains an interesting examination of the different forms of syllogism with a view to determine which are valid and the *Nyayapraveça* illustrates fully the different forms of fallacy.

The essence of the doctrine of Dignaga is the exposition of a theory of logic, in modification of the established doctrine of the Nyaya to harmonize with the fundamental idealism of the school of Asaṅga. The views of Asaṅga were historically a modification of the extreme scepticism and nihilism of the doctrine of vacuity (*śūnyavāda*) which is associated with the name of

Nāgārjuna¹ While Nāgārjuna deduced from the utter incompatibility of our ideas that there was no reality either beyond them or in them the new doctrine was compelled to admit that so radical a doctrine contradicted experience too widely to be acceptable and it fell back on the theory that while there were no realities external to the mind nevertheless thought itself was not unreal though in accordance with the essential tenets of Buddhism they could not admit the existence of a soul or self. This thought for them assumed two forms: consciousness proper (*alaya vijñāna*) which lasts until the individual reaches Nirvāṇa and which serves in lieu of the substantial soul and the thoughts of the individual about things (*pravṛtti vijñāna*).² It seems however that Dignāga's³ logic went beyond this standpoint: his doctrine of perception manifests elements which are not in harmony with the view that all reality is thought. As has been mentioned he distinguished perception sharply and definitely from imagination and declared that what it gave was what was without name class &c. an idea which recurs in the indeterminate perception of the schools. Whereas on a strictly idealistic theory in the ultimate issue perception should not have remained distinct from other mental processes⁴ he appears to have held the view that in it man came into contact with a reality which though lasting but an instant (*ksaṇīcī*) was in truth real (*astīti paramārthasat*) but at the same time, because of its momentary character was

never knowable. For the actual formation of any idea to the datum of perception or sensation there fell to be added the working of imagination (*vikalpa*) a conception which is, certainly not without justice to be compared with the Kantian doctrine. In a similar strain Dharmakīrti develops a doctrine of perception which he defines like Dignaga as distinct from imagination but qualifies as without error (*abhīranta*)¹. In perception there is a two-fold object that which is immediately apprehended or contributed by the datum (*grahya*) and that which results from the operation of thought (*niṣcaya*) set to work by the force of the apprehension. The first corresponds to the momentary element the second to the series of momentary impressions (*kṣana samūhina*) as they are worked up by thought into a unity and this is what is known not the momentary impression which lies beyond knowledge². According to the proximity or remoteness of an object of perception the perception varies this is its peculiar characteristic (*svi lakṣaṇa*) and proves it to be a reality (*paramārthasat*) and it shows that it possesses practical efficiency. In this view there is further advance towards an assertion of the reality of something beyond thought, but the position is not inconsistent with that of Dignaga³ and it is clearly analogous to the view of the Vaiśaṅkikas who appear in the *Sarvadarśanasaṁgraha* as adopting the terminology of Dharmakīrti.

For Dignaga therefore the whole of knowledge despite its contact at one point with an unknowable reality, is made up of ideas involved in both perception

¹ NB., p. 163, cf. on *kalpanā* NV, pp. 43-5. TR pp. 60-61 above ch. II, § 1. SBNT pp. 3²-6.

² NB. p. 16².

and inference these ideas are the product of our mental activity (*māpnaçakti*, *prāpaka vyāpara*),¹ and are not created by any external cause. In a passage happily preserved for us by Vacaspati Miçra² he denies emphatically that there can be any real thing indissolubly connected which can be the logical ground of anything, since the relationship of logical reason and consequent does not depend on external reality, but on the relationship of attribute and subject which is a creation of the mind. The ideas thus obey laws of connexion not imposed by reality, but by the action of our own thought (*buddhy urūdhā*, *niçcayārūdhā*³), and thus *a priori* in character. The nature of these laws is further made explicit by the division of the syllogism on the basis of the relations of identity, cause and negation. It is impossible to ignore the principle underlying this division: it corresponds to a classification of judgement based on the relation of subject and attribute first into positive (*vidhā*) and negative (*anupalabdhi* = *pratiśedha*) while the positive judgement is then divided according as it is based on identity i.e. is analytic (*svabhāvanumāna*) or is based on causality, empiric (*kāryanumāna*). Reduced to a Kantian form we can recognize, without too much pressing the ideas *a priori* of substance and attribute being non being identity, and cause, a list which has sufficient affinity with the Kantian categories to be more than a mere curiosity of speculation. All

¹ NBT, p. 15, cf p. 16 *samāna eva ca p'atijakasya prīpan yah.*

² *sarve gam anumānaṁ nyabhāṣy buddh-jarī dhena dharmadharma bhaccena na bahiḥsattirama apakante*, NBT, p. 127, with *nyajena* in A. śūla on ŚV. *Āvalambanarūpa* 167, 168 (JBRAS xviii 230). Kumārila's reference is clear. For the Sautrāntika and Vaiśbhāsika views see SDS, pp. 14ff, 18, SSS iv 3.17, 4 18, 19. The parallelism with the former (de la Vallée Poussin, *Musson*, ii 67) seems less than with the latter, who appropriate Dharmakīrti's definition of perception, cf NBT, pp. 16-20.

³ NBT, p. 30. Cf Berkeley, *Sis*, § 305.

our ideas or the objects which we know are indissolubly linked with one another since they are either inferable from them by means of analysis or related as cause and effect. The real relations between the unknown things which lie beneath our knowledge are indifferent to us and have no part in forming our ideas¹.

The division of the syllogism in this way is not recorded of Dignaga and by Sureṣvara² is expressly attributed to Dharmakīrti. This view is confirmed by a passage from Dharmakīrti quoted by Āryaḥara³ where it is said 'The rule according to which there exists an indissoluble connexion between ideas or objects does not arise from observation or non observation but from the laws of causality and identity which have a universal application. There is of course nothing inconsistent here with the view of Dignaga, which rather acquires greater precision by the new matter thus added.

The theory of the ideal nature of the indissoluble connexion which lies at the base of reasoning thus presented stands in close relation to the idealist view of the world of the Yogacara school and therefore there is *a priori* no ground for supposing that the idea was borrowed by Dignaga from Prajñāpāda or from one of his predecessors. In truth it is obviously easier given an idealistic hypothesis to conceive an indissoluble connexion which it lies in the power of the mind to impose than to arrive at such a result from the standpoint of realism. How can it possibly be said on the basis of our imperfect experience that things are indissolubly connected?

Praçastapada does not attempt to answer this problem the theory of a peculiar variety of perception (*jñāna laksana*) is a later effort to meet the need of an explanation of how a universal connexion can be assumed from experience. *A priori* therefore it is more reasonable to assume that Praçastapada owes the principle to a school in which it had a natural right to exist¹. The argument² against this view that, had the Buddhists invented for themselves the concept of indissoluble connexion they would never have set up the real categories of identity, causality and non existence, which on the other hand are comparable with the older Vaiçeṣika list of Kanāda loses all its force when the true nature of these divisions is realized moreover the argument is based on ignorance of the fact that the doctrine as it first appears in Dignaga has not this addition.

There is however, positive evidence that the introduction of the idea of indissoluble connexion was recognized in the Nyāya school as due to Dignaga. Uddyotakara³ carefully refutes a doctrine which attributes the name of syllogism to the demonstration of something as indissolubly connected with something else by one who has certain knowledge. Uddyotakara objects that, as in the Buddhist view everything is indissolubly related to everything else the knowledge in question of a thing as indissolubly connected is no more than knowledge *sans phrase* and not inference. Now not only have we the assurance of Vacaspati⁴ that Uddyotakara's criticisms are usually directed against Dignaga but he actually assigns the doctrine impugned to that authority,

¹ Stel'erbatskoi, *M* is on v 134 45

and explains that it stands in close relation to his theory of knowledge which admits as the basis of reasoning the power which the understanding has to create its own objects distinguishing in them the aspect of subject and attribute while not dealing with real relations. It is significant that here and elsewhere Uddyotakara¹ admits that there are exceptions to the rule of indissoluble union even in the case of smoke and fire since not only does fire occur without smoke as is generally admitted but also smoke without fire which contradicts the fundamental assumption of the stock syllogism of the schools. In yet another place Uddyotakara,² dealing with inference from effect to cause discusses and rejects the idea of indissoluble connexion and Vacaspati³ again attributes the doctrine to Dignaga, and emphasizes its accordance with the Buddhist theory of knowledge. There is also a significant verbal similarity in the account of indissoluble connexion given by Praçastapada⁴ with that of Dignaga as reported by Uddyotakara.

In Dignaga⁵ and in Dharmalīrti⁶ we find clearly expressed the three conditions which must be fulfilled by the middle term if the syllogism is to be correct the conditions being further used for the purpose of explaining the classes of defective middle term. We find the fact recognized clearly in Uddyotakara⁷ who criticizes the doctrine evidently as Vacaspati⁸ assures us as he found it in Dignaga himself. The formula runs: The middle term must be present in the subject also in similar cases and be absent in dissimilar cases. The

⁸ NVT p 1

critic objects that the language should have made it clear that the middle term must be present in the whole extent of the subject and not in part alone, that, while it must only appear in similar cases, it need not appear in each of them, and that it must be absent from all dissimilar cases. The nuance indicated is expressed in Sanskrit by the word *eva* and Vacaspati assures us what would otherwise be plausible that the formulation of the doctrine of the three conditions has been affected by the Buddhist doctrine of the negative or rather relative signification (*upalā*)¹ of words. On this view a word has not the power (*śakti*) attributed to it by the Mimamsā to communicate to objects the verbal form under which we conceive them, or to express the real nature of anything; it merely serves to distinguish it from other things and in a proposition in view of the necessity of making clear the precise implication of terms it is usual to append *eva* to the word to which special significance attaches as a mode of reminding the hearer or reader of the need of attending to the implication. Now it is recorded that in this special case Dharmakīrti criticized Dignāga apparently because the latter held that one *eva* was sufficient to bring out the full implication of the rule regarding the three conditions of the middle term while Dharmakīrti held that in each case the important term must be stressed in this manner and in face of this fact Uddyotakara's criticism reveals clearly its Buddhist origin which is the less surprising since we now know that Dharmakīrti and the Uddyotakara were contemporaries.

Yet a further proof of the dependence of Praçastapada on Dignāga may be derived from the fact that the

¹ Ratnakīrti *Apohasiddhi* SBNT pp 1 19 Stcherbatskoi *It is on* v 165 ? QV pp 290-323 NK pp 31 90 *Āt nālatīvar veka* pp 30 48 51 \NT, pp 340 ff \BT p 1 NV pp 304 ff

distinction of reasoning for oneself and reasoning for another which gives syllogism, is present in Dignāga and is expressly stated by Dharmottara in his commentary on *Dharmakīrti*¹ to have been introduced by him, and to stand in relation to his theory of the function of language in knowledge. Denying as Dignāga did the authority of either the sacred scriptures or even of a master, he reduces the authority of verbal testimony to its true character. In the *Pramāṇasamuccaya*² the rejection of verbal testimony as a separate and independent source of knowledge is based on the argument does credible testimony mean that the person averring it is credible, or that the testimony is credible? If the former it is mere case of inference from the credibility of the speaker in the latter, it is a case of perception. In the work of Dharmottara³ the same view of the credibility of testimony is emphasized in a new form testimony is a product of the true external fact with which it is immediately connected. Thus the syllogism in so far as we draw from it true knowledge is not a source of knowledge by reason of its words but by reason of the facts on which these words rest a syllogism therefore, is a source of knowledge only in a metaphoric sense (*anupamika*) for it is the facts, not the words which are the source of knowledge. Praśasta-pada's debt to Dignāga in this regard is clear, despite his slight change in terminology⁴ which may legitimately be attributed to a desire to conceal his borrowing, for he retains in practice if not in theory verbal testimony as a separate means of proof, while adopting the principle

¹ NBT, pp. 46, 47

⁴ *śāstra śikṣā* in lieu of *śāstra*. NSāra, p. 3 line 20 & 21

of distinction between reasoning for oneself and reasoning for another which in truth rests on the fact that verbal testimony is no true means of proof at all

The same dependence of Praçastapada on the Buddhist logic can be traced in detail in the doctrine of fallacies, and it is significant that he alone accepts the fallacies of the subject and of the example which play a marked part in the logic of Dignaga. Nor is it fanciful to ascribe to the same influence the adoption by Praçastapada of the form of exposition which he uses, and which makes no effort in the manner of Vatsyayana to follow the order of the text of the original Sutra. So deeply indebted was Praçastapada to Dignaga that to ascribe this point also to his influence is natural and convincing.

To preserve the theory of the priority in invention of the conception of invariable connexion to the Vaiçeṣika school we should be compelled to postulate its appearance in that school at some period before Dignaga and assume that the tradition of its discovery had been lost so early that Vācspati Miśra found no trace of it in the works which he could use in compiling his treatise on the Nyaya. The conjecture in the absence of any positive evidence would be unsatisfactory, and the originality of Dignaga is supported by the fact that we can trace in his immediate predecessors an interest in the problem which suggests that it formed the subject of investigation to an extent likely to result in the precise formulation of the true doctrine. Thus from Chinese sources we know that Maitreya who is stated to have been a teacher of Asaṅga, framed the syllogism as follows

Sound is non-eternal

Because it is a product

Like a pot but not like ether

A product like a pot is non eternal

Whereas an eternal thing like ether is not a product

Asaṅga himself framed the fourth and fifth of these clauses differently so as to run

Because a pot is a product it is non eternal so is
sound because it is a product

Therefore we know sound is non eternal¹

To Mātīeja therefore the argument was simply from instance to instance the form accepted by Asaṅga though it still is based on the example, shows a clear effect to attain the general principle which alone is effective as a reason In Dignāga's² formulation the syllogism runs

The hill is fiery

Because it has smoke

All that has smoke is fiery, like a kitchen and what
ever is not fiery has no smoke like a lake

The retention by Dignāga of the homogeneous and heterogeneous examples is interesting; it recalls the rule of Gautama and is re-echoed by Praçastāpadī

A further step is taken by Dharmakīrti⁴ whose exposition in the *Ayāyabindu* is divided into three parts only in lieu of the six of the *Pramanasamuccaya* namely perception inference for oneself and inference for another He maintains that the example is no real part of the syllogism since it is implicit in the middle term In the reasoning The hill is fiery because it is smoky like a kitchen the term 'smoky' which implies fire includes a kitchen and other smoky things and the example is all but unnecessary Nevertheless the example has so far value in that it points out in a

¹ *Med Log*, p. 14 ff. Sogura *Hindu Log*, pp. 30 ff.

² *Med Log*, pp. 30-31. The thing to be proved in his view is the hill as possessed of fire a view rejected in *NV*, pp. 52-4, in favour of smoke qualified by fire so PSI M, p. 40, as opposed to Kumārila.

³ How far Vasubandhu anticipated Dignāga's doctrine of *vyapti* does not appear from our scanty information. *Med Log*, p. 17.

⁴ *Med Log*, pp. 114-115.

particular and therefore more impressive manner what is implied in the general proposition

With Dignāga and Dharmakīrti the progress in logic made by the Buddhists appears to have come to a head it was the logic of Dignāga which was carried to China by the famous pilgrim Hiuen tsang who acquired it in the course of his long stay (A D 630-45) in India and introduced into Japan by a Japanese pupil of his the monk Dohshoh¹ In India the Nyaya school was driven by the necessity of making headway against the new doctrine of the heretical school to revive the study of logic the movement taking form in the elaborate commentary of Uddyotakara in which he sought to refute Dignāga The work however is not confined to this end it takes into account as was inevitable the views of Prācīnastapada on logic and it marks a definite stage in the process of amalgamation of the schools Dharmakīrti answered Uddyotakara but after him no new element of vital importance appears to have been introduced into the study² The questions which have occupied the earlier writers were the subject of minute examination difficulties real and fancied were developed and explained in abundance and the doctrine received in Gaṅgeśa's *Tattvacintamani* its final form save in detail It was in this shape that the doctrine passed into the syncretist school of Nyaya Vaiśeṣika all of whom save Ācārya accepted the Nyaya logic as the basis of their system without substantial change

¹ S. ōgiura *Ind. Log.* pp. 33 ff

² Dignāga and Dharmakīrti were much criticised in other schools e.g. by Kumārila and Sureśvara The Mīmāṃsā school in logic a metaphysical school and not traces of Nyāya Vaiśeṣika influence Prabhākara's date is unfortunately uncertain the tradition (e.g. SSS 19 vii 15) of his posterity to Kumārila is unpalatable PSPM pp. 11-17 Uddyotakara (e.g. NY pp. 55-56) criticises views like his on inference (PSPM pp. 89-100) but not so as to prove his priority

3. *The Final Form of the Doctrine of Inference.*

Inference in the normal definition of the modern school¹ is the proximate cause of the inferential judgement or knowledge (*anumiti*), and this knowledge is of a special character, distinct from that attained in perception. To Buddhist logic² the distinction lies in the fact that perception gives, though inexpressible in words, the peculiar character (*sva-lakṣaṇa*) of the momentary object, while inference deals with the ideal generality (*samānya-lakṣaṇa*), but this view is not, as has been suggested, that of the Nyāya. In the strict sense of the term, as Uddyotakara³ points out, the peculiarity of the object is inexpressible, for all the terms denote at once generality, individuality, and form. Moreover,⁴ the doctrine of perception insists that in it we grasp at once generality and individuality in the determinate form, which is the only one known to us, and all means of proof give us knowledge of generality, particularity, and that having it. The distinction between the knowledge we obtain by perception and that given by inference rests, therefore, on the fact that in perception we know the individual in its concrete detail as well as its generality, &c., in inference we deal with generality, &c., in an abstract form alone, we have on the one hand before us the crackling fire, on the other hand we infer the existence of fire past, present, or future as a generality connected

¹ TC, ii. 1 ff., SP., §§ 142-53, TA., pp. 17-19, TB., pp. 31-42, TK., pp. 10-12, TS., §§ 44-51, BP. 66-70, 142-143, TR., pp. 63-70.

⁴ NV., p. 6, NVT., pp. 12-14; NVTP., pp. 139-50, PBh., p. 156, NK., pp. 183, 190, ŚDST. 67, cf. QV., pp. 232-93, 332-4, PSPM., p. 95.

with smoke and the precise detail of the fire which causes the smoke never appears to us

As the nature of the knowledge obtained by inference differs from that gained in perception so the inferential process differs from the process of perception. An inferential judgement is defined as the knowledge which is due to reflection or consideration (*paramarśa*) and consideration in its turn is defined as the knowledge that the reason is an attribute of the subject and is invariably connected with the conclusion which is to be proved of *the subject*. The definition of consideration is of first importance in the doctrine of inference and this is emphasized in an early doctrine recorded in Uddyotakara¹ which defines inference as consideration or reflection regarding the reason (*linga paramarśa*). The process as explained by Keçava Miçra is as follows: the first stage in the operation leading to inferential judgement is the perception of the invariable connexion between smoke and fire a result due to frequent observation of the concurrence of the two in a kitchen or elsewhere. Then smoke is observed arising on the mountain. Thirdly through remembrance of the relation which perception has established between the smoke and the fire there arises reflection in the form that there is on the mountain smoke which is always accompanied by fire upon which supervenes the inferential judgement. The mountain is fiery.

The value of the conception of inference as a mental process is obvious and is enforced with minute detail by the school. Merely to set the two premisses: The mountain is smoky. Smoke is always accompanied by fire side by side would amount only to the assertion of

¹ NV p. 47 of Uddyotakara in TR p. 65. TB pp. 31-3, 36 or *Avyākaraṇa* the first and second stages being knowledge of smoke in the distance then knowledge of the concomitance. NSM p. 88.

a perception actually present and the result of past perception¹ The second premiss again must be made an attribute inherent in the first if there is to be any result for the middle term or reason must be brought into direct connexion with the subject² to be proved if there is to be any inference It is not enough that the invariable concomitance should be made an attribute of the reason as in fact of course it is true that the reason and consequence are invariably connected but the mere fact is not enough for inference There the knowledge of the concomitance must be simultaneous with the perception of the smoke on the mountain in other terms, the concomitance must be an attribute of the perception of the smoke on the mountain and not of the smoke in itself Similarly from another point of view stress is laid on the fact that the subject (*pak* & in the new terminology) cannot be a thing *per se* it must be something regarding which there is a desire to establish something else (*sasadhayisā*) for only then does it come within the sphere of inference The desire may of course be for one's own sake or for the sake of some one else and it does not matter that we may have the same knowledge from some other source as long as we have the desire to establish it by inference

This recognition of the mental activity of inferring³ as the decisive feature in inference leads to an important discussion between the older and later schools as to the precise factor which is to be deemed the proximate cause of inferred knowledge or in other words what precisely is to be deemed the inference as a process The answer obviously depends in part on the meaning assigned to

¹ Cf TS. § 44, with Athalye's note

² *palsadhārśanā* cf TC II 40-41 NSāra p. 6. The reason is styled *īṅga*, *ke'u*, or *aldhana*.

³ Cf the modern doctrine e.g. Bosanquet *Logic* Book II ch. vii

proximate cause (*lāna*) Its sense in the normal use of language is instrument, and therefore one definition of *lāna* makes it to be a cause possessing an activity (*vyāpāraṭ lānaṃ*) that is to say a cause which by means of its function or activity, produces a result. Accepting this definition two interpretations of what is the real cause of inferential knowledge are possible. In the first place the view which is more or less clearly expressed by Kanada¹ and emphasized in his commentators that the cause is the reason or middle term may be held subject to the correction that the knowledge of the reason (*linga jñāna*) must be substituted for the reason (*linga*). This view is however rejected for the obvious reason that mere knowledge of the reason produces no inference it is only knowledge of the reason as existing in the subject and invariably concomitant with the consequence. In the stock example mere knowledge of smoke as such or as existing on the mountain yesterday is no ground for the inference of fire on the mountain to-day the smoke is gone and cannot therefore since it has ceased to be become the instrumental cause of anything. The other alternative which is the view of the older Nyāya followed by Viśvanātha² is to treat the knowledge of the invariable concomitance as the proximate cause assigning to it as its function the reflection (*parāmarśa*) which in that case must be regarded as consisting of the knowledge of the presence of the reason in the subject (*paksadharmatayāna*). The more recent theory is that adopted by Ānāṇīya³

¹ III. 1. 14 ix. 2. 1 P.B. p. 201 T.A. p. 1" cf. *lāgadārpaṇa* as one view in NY, p. 47 conceivably a reference to P.P.M. p. 48

² BP. 66 cf. *lāgal āgama-bandhanā* or that aided by perception of the concomitance as views in NY p. 47

³ § 146; see NY pp. 47-48 when this is deduced by recollection of concomitance (*lāgal āgama-bandhanā*) is accepted

Gangeṣa¹ Annam Bhaṭṭa² and Laṅkāśi Bhaskara who adopt the view that the cause is that which immediately and always precedes the effect the reflection therefore which regards the middle term as an attribute of the subject and invariably concomitant with the consequence is therefore the cause of inferential knowledge a view which is supported by an appeal to the facts of language the term instrument applies naturally to some material thing which can possess an activity not to know ledge whether of the reason or of the invariable concomitance

The view however, which thus insisted on a mental activity as the essence of inference was not accepted universally the Mīmāṃsā adopted a view more akin to the concept of formal logic which sets the major and minor premisses side by side without insisting on the mental act of combination But this view the Nyāya decidedly³ objected to and definitely rejected on the simple but conclusive ground that the mere setting together of propositions gave no result and that equally the memory of the concomitance and the perception of the presence of the reason in the subject remained fruitless unless they coalesced in a single mental act

The essence of inference therefore rests on the invariable concomitance (*vyāpti*) between the reason or middle term (*vyāpaka*) and the consequence or major (*vyāpaka*) terms which if perhaps in origin having a real inference⁴ are developed as logical for the school abandons any idea of setting out in detail the real relations at the basis of inference But reality⁵ underlies inference and we must

¹ TC 2 vy p v f : apahadharma ā ānam

² TS § 47. ³ NSM pp 86 87

⁴ The *vyāpaka* need not be more extensive than the *vyāpaka* 50 is *vyāpaka* of 100

⁵ PBh p 201 TC ii 27 ff TR p 65 TK p 11 TS § 44

ask how is the invariable concomitance known? In the first place we must admit that mere observation of concomitance in a special case or a few cases is not enough for logical purposes to attain certainty the knowledge of coexistence must be accompanied by the absence of knowledge of any contrary case i.e. we must use the method of *positive and negative instances*. If a discrepancy can be adduced or is suspected then it must either be shown to be merely apparently an exception or the doctrine of concomitance must be admitted to be conditional (*aupadhiya*) and therefore useless for logic. If however no concrete case is adduced but it is argued on general grounds that not even all the cases which have been observed though numerous are enough to give certainty of universal concomitance the only reply is to show that a contrary instance is really impossible. This may be done by careful examination of the concomitance itself which may prove to be irresistible or it may be shown by the use of the *reductio ad absurdum* (*tarka*)¹. The man who denies that from smoke we can infer fire is confronted with the result that he must contend that there are cases in which smoke is not connected with fire but arises from some other cause, which is contrary to all experience and he is driven to admit that after all we are entitled to deduce fire from smoke. So for the moment we escape the danger of arguing in a circle which is obvious if we try to show that it exists because it is found in so many cases since for such an inference as for all others a concomitance is an essential prerequisite and *ex hypothesi* no concomitance has yet been established. It is obvious however, that the question is not yet solved for the validity of our indirect proof in the ultimate issue rested upon concomitance

¹ Above ch. 1 § 3

in this case a negative one so that the real character of concomitance is as far from solution as ever.

The definitive reply to the question of the mode in which a concomitance is known is, therefore, based on the view expressed in Gautama¹ that inference depends on perception but the crude idea which doubtless dominated the earlier view has made room for a more subtle doctrine, in which supernatural or transcendental (*alaukika*) perception takes the place of the simple contact of organs of sense and object. When we see any object we see also its generality (*samanya*) including all other possible members of the class: thus by this peculiar mental contact (*samanyalaksana pratyakṣi*) we appreciate the generality of smoke and of fire. Further by yet another contact, whose characteristic is knowledge (*manalaksana*)² we realize the universal concomitance of the two smoke and fire so that the moment we see smoke we at once have knowledge of fire as connected with it. This is not a process of inference for there is no possibility of the operation of reflection (*paramarśa*) in its production and it differs from ordinary perception, as there is not a connexion between the object and the senses in all the times and places in which the former exists. The nature of the *reductio ad absurdum* now becomes plain: it does not serve to prove or create the knowledge of the universal concomitance, it is only accessory or contributory to remove doubts and to make the knowledge of the concomitance free from uncertainty. Nor again is

¹ 1.1.5 cf. ÇV, pp. 68 ff., 200 ff. SDST, pp. 61-62. Proof by positive and negative instance is applied to every conceivable topic. Cf. SS v. 28 ff. Cf. B. Seal, *Positive Sciences of Ancient Hindua*, cl. vii.

² Above, ch. II, § 3. *Pancacikha* is credited in SS v. 32.6 with a view suggesting that concomitance is a mental concept imposed on things, not an expression of a reality, but the value of so late evidence is minimal. The perception of generality is accepted in *Mīmāṃsā* PSPM p. 20. Cf. NSM, pp. 81 ff.

the generality which we perceive a mere mental figment in the view of the school of this period, it is an absolute reality¹ but it exists only in the individuals in which it appears and is not hypostatized as something apart from the individual substances or attributes or activities in which it resides

The concomitance² as we have seen can be either positive or negative and in the normal case in regard to a subject and an attribute it is possible to establish both relations. Thus in the judgement, 'Where there is smoke there is fire' we have a positive concomitance to which there is the negative counterpart 'Where there is no fire there is no smoke'. The rule of the school to append the examples of both to the statement of concomitance is duly carried out in both cases, a similar case (*sapakṣa*) is a case in which the conclusion i.e. fire is present but no smoke need not be present with fire a concomitance must be illustrated by something more a demonstrative example (*distant i*)³ that is one in which not merely fire but smoke is present as in the kitchen. The counter case (*vipakṣa*) does not admit of such duality it includes all that has no fire and therefore all that has no smoke.

In other cases we do not find the possibility of positive and negative concomitance. In the proposition 'The pot can be named since it is knowable' the concomitance can be positive only (*kevalanvayan*) since while it is true that 'What can be known can be named' the proposition 'What cannot be named cannot be known' cannot be established, since no probative example can be adduced for it seeing that only of what can be known

¹ *naman janyate tasyaiva tatva* TB p. 31 at b/a has *t* as *bandho* *nyaya* h. ib. d. p. 30 below ch. vi § 3 Cf. QV p. 21*.

² Not in NS, but in NV p. 48 TC ii 735ff.

³ Only this is recognized as valid for reasoning by PSPM p. 51 QD p. 48.

can anything *ex hypothesi* be known. On the other hand, in the proposition 'Living organisms have souls, since they possess animal functions', there can be a negative concomitance only (*kerala vyatireka*), since the proposition 'What has no soul has no animal functions' can be illustrated by the case of the pot but the positive proposition 'That which has animal functions has a soul' cannot be illustrated since the conclusion has precisely the same extension as the subject and cannot therefore be found anywhere outside it. In the case of negative concomitance only it is therefore impossible to adduce any example (*apaksa*) in the positive concomitance only it is impossible to adduce any counter example (*vipaksa*).

The relations thus stated may be illustrated by the accompanying diagram.¹

The circle S represents the subject the circle M the reason and the circle P the conclusion (*sadhyā*). The space between the circumference of S and that of P represents the whole field of examples part of which falls within part without the circle M, the former alone giving the probative example (*distanta*). All the space outside P represents the counter examples (*vipaksa*). In

¹ Jacobi, *NGWG* 1901 p. 466

the normal concomitance which is at once positive and negative (*anvaya vyatirekin*) we have the positive sphere 'Where M there P', and the negative 'Where no P, there no M'. To represent the purely negative concomitance it is necessary to assume that S expands to the dimensions of P, in which case of course M must expand likewise, there then remains no room for an example and only a counter example is possible. To illustrate the purely positive concomitance it is necessary to assume that the circumference of P disappears and the possibility of a counter example is abolished.

In place of basing the distinction of positive-negative positive only and negative only on the concomitance, it is also possible to classify the middle terms on the same principle.¹ A procedure which does not differ in substance from the more natural one here adopted of treating the concomitance as the seat of the distinction. Applied to the inference or the middle term however, the scheme tended to produce results which were early criticized and which though ascribed by Ācādhara² to Praṣastā and would apparently not have been accepted by that author.³ It is a less serious matter that the positive inference operates with a conclusion which is co-extensive with existence and thus departs widely from the normal form of conclusion.⁴ The objections however to the purely negative inference (*kevala vyatirekin anumāna*) are overwhelming. All the terms in it have the same extension and thus the essential characteristic of inference the use of a general principle to demonstrate something disappears as there is no particular case to

¹ TC. ii 730-9

³ At p. 239 however, he seems to admit a *kevala vyatirekin* argument all appear in NSāra p. 6. TL., pp. 20-80 below ch. iv § 2. NS pp. 123-32 elaborately justifies all the cases.

⁴ NSM pp. 67 ff. replying to Mīmāṃsaka and Buddhist views.

which the principle can be applied. Moreover to arrive at a positive conclusion from a negative is in itself an unusual procedure and if Praṣastapada denied that either form was a correct syllogism he had much reason to support his action. The Nyāya contends, indeed, that as every negation has a positive opposed to it there is sufficient positive element available to produce a reflection (*pramāṇa*) and to induce a result but the effort is plainly unsatisfactory and unconvincing. But the doctrine¹ was held firmly against the contention of the Vedānta and the Mīmāṃsā² that in such a case there was to be recognized the mental process constituting a separate means of proof called presumption (*arthapatti*). The stock example of this is the inference: Devadatta though he is fat does not eat during the day and therefore must eat at night. The Nyāya formulates the proposition as a purely negative inference: Devadatta eats at night because he is fat without eating in the daytime. The positive concomitance: He who is fat without eating during the day eats at night cannot be observed but the negative proposition: He who never eats is never fat fills in *hi* our immediate experience. Similarly the *reductio ad absurdum* in its formal aspect is defended by the Nyāya as an example of the purely negative inference.

The validity of inference was assailed by the Carvaka school who maintained the impossibility of legitimately establishing an invariable connexion: the Buddhist reply rests on an ideal construction as expressed in the concomitance not on a real relation. A somewhat similar view is attributed in one version of the *Sūtra* to

¹ TC. II 5th ff. 615 ff. VSara pp. 32, 33, 23, 4th TR. pp. 96, 101
Kir. p. 101. Kux. I: 19. NSM pp. 8th 89. cf. KKK I. 31-35.

Sūtra to *Pañcāṅkha* probably without regard to historic fact as that author was probably anterior to the period of the discussion of concomitance. The *Sūtra* itself assumes an innate power in the things which are concomitant. *Çāṅkara* also admits the validity of inference, subject however to the superior authority of scripture which alone gives us absolute truth while the *Nyāya* contends for the absolute value of inference as based on perception¹.

4 *The Final Form of the Doctrine of Syllogism*

The syncretist school* follow without question the doctrine of *Praçastapada* that there is a fundamental distinction between inference for oneself which is true inference and inference for another which is styled inference therefore only by an analogy. Inference² for another is the exposition by means of a proof consisting of five members of a thing which has already been ascertained for oneself. Or in other words as stated by *Dharmottara*,⁴ the inference for oneself is notional (*grāntāmaka*) is opposed to that for another which is verbal (*śabdātāmaka*) though unlike the Buddhists the logicians do not carry the concept to the natural result of recognizing that there is no place in their system for the concept of verbal testimony as a special kind of means of proof. Syllogism therefore is inference in a modified

⁴ *NBT*, p. 21.

and secondary sense since it is the cause which produces in the mind of the hearer or reader the knowledge of the universal concomitance which is the true base of inference. In the Nyaya view there is an essential distinction between the effect of verbal testimony and that of syllogism in the first place the information imparted is accepted without any activity on the part of the hearer in inference as communicated by the syllogism the hearer must perform the necessary mental operation which the teacher has already performed and which he now aids by syllogistic exposition the hearer to perform for himself. There can therefore be no vital distinction in principle between inference and syllogism any inference can be thrown into syllogistic form for one's own satisfaction if desired and it must be so treated if it is to be communicated to another. The difference therefore reduces itself to a difference of aspect the one deals with the process of inference the other with its formal expression or *vyavahārika* has it the one is characterized by substance (*ātmapratyaks*) the other by sound or words (*śabdapratyaks*).

Syllogism which bears the name *naijajā* then consists of a collection of propositions arranged in due order or in the formal definition of Gaṅgeśa² is an exposition which produces a verbal knowledge whence arises in the hearer the knowledge of the invariable concomitance and of the presence of the characteristic in the subject knowledge which is the last cause of inferential knowledge. The number of members remains fixed at five as in Gaṅgama with the traditional names of proposition (*pratijñā*) which states the subject with the conclusion as an attribute, reason (*hetu*) which ascribes to the subject the middle term which serves as the means of

¹ SP, § 151

² TC II 691, 692 For *naijajā* as reasoning generally cf NY IV 1 11

Sūtra to Pūṇḍarikā probably without regard to historic fact as that author was probably anterior to the period of the discussion of concomitance. The *Sūtra* itself assumes an innate power in the things which are concomitant. Ānandīśa also admits the validity of inference subject however to the superior authority of scripture which alone gives us absolute truth while the Nyāya contends for the absolute value of inference as based on perception¹

4 *The Final Form of the Doctrine of Syllogism*

The syncretist school² follow without question the doctrine of Prācāstāpada that there is a fundamental distinction between inference for oneself which is true inference and inference for another which is styled inference therefore only by an analogy. Inference³ for another is the exposition by means of a proof consisting of five members of a thing which has already been ascertained for oneself. Or in other words as stated by Dharmottara⁴ the inference for oneself is notional (*śānatmaka*) as opposed to that for another which is verbal (*śabdātma*) though unlike the Buddhists the logicians do not carry the concept to the natural result of recognizing that there is no place in their system for the concept of verbal testimony as a special kind of means of proof. Syllogism therefore is inference in a modified

³ PBh. p. 231. NSara. p. 5. Max Müller's asser. pt. off. of the distinction to rhetorical ends is erroneous (*Six Systems* pp. 567 ff.) cf. NSM. pp. 117-118.

⁴ NBT, p. 21.

and secondary sense since it is the cause which produces in the mind of the hearer or reader the knowledge of the universal concomitance which is the true base of inference. In the Nyaya view there is an essential distinction between the effect of verbal testimony and that of syllogism, in the first place the information imparted is accepted without any activity on the part of the hearer in inference as communicated by the syllogism the hearer must perform the necessary mental operation which the teacher has already performed and which he now aids by syllogistic exposition the hearer to perform for himself. There can therefore be no vital distinction in principle between inference and syllogism any inference can be thrown into syllogistic form for one's own satisfaction if desired and it must be so treated if it is to be communicated to another. The difference therefore reduces itself to a difference of aspect the one deals with the process of inference, the other with its formal expression or as Çivaditya¹ has it the one is characterized by substance (*atharupatva*) the other by sound or words (*śabdārupatva*).

Syllogism which bears the name *nyaya*² then consists of a collection of propositions arranged in due order or in the formal definition of Gaṅgeśa³ is an exposition which produces a verbal knowledge whence arises in the hearer the knowledge of the invariable concomitance and of the presence of the characteristic in the subject, knowledge which is the last cause of inferential knowledge. The number of members remains fixed at five as in Gautama with the traditional names of proposition (*pratijñā*) which states the subject with the conclusion as an attribute, reason (*hetu*) which ascribes to the subject the middle term which serves as the means of

¹ SR, § 131

² TC II 691, 692 For *Nyaya* as reasoning generally cf. NV IV 1 II

connecting it with the conclusion, example (*udaharana*) in which the concomitance is given in full with an example either positively or negatively, the application (*upanaya*) in which there is attributed to the subject the middle term characterized as being a member of the concomitance and the conclusion (*nigamana*) in which it is declared that the consequence is an attribute of the subject. The purpose of the five members is stated formally¹ to be to teach the knowledge of the subject the syllogistic mark the knowledge of the concomitance, the knowledge of the syllogistic mark as an attribute of the subject and that there is nothing opposed to the final result reached in the conclusion. In its typical form the syllogism is thus exemplified

The mountain is fiery

Because of smoke

Where there is smoke there is fire as in a kitchen or

Where there is no fire there is no smoke as in a lake

And so (it is provided with smoke which is invariably accompanied by fire) is this (mountain)

Therefore is it so (it is provided with fire)

In the example² now misnamed the concomitance may be expressed in two ways either as given above or in the adjectival form. Whatever has smoke that also has fire or Whatever has the absence of fire that has also the absence of smoke. The latter mode of expression is the more frequent in harmony with the tendency of the language to nominal expression. The application and conclusion in Sanskrit are framed in the enigmatic *tatha cajam* and *tasmat tattha* the historic ground of which we have already seen. The scheme which is normal must be modified slightly for the purely positive and the purely negative inferences since in these only

¹ Cf NBh. p. 45

² TC I 740 ff. NSara pp. 12, 135-8. TR. p. 180

one form of concomitance can appear under the example and in the latter a negative is necessary in the second last member of the syllogism.¹

The characteristics of the syllogism are obviously not without relation to the nature of the Sanskrit language. The preference carried out to the full extent of a positive result is rendered easy by the fact that every proposition can be thrown into a positive form by the simple expedient of using the qualification of non existence (*abhāva*) and saying that the mountain possesses absence of fire in place of saying that the mountain is not fiery. Similarly no hypothetical result is necessary as we have seen the concomitance can be expressed in the form of two correlative clauses but it can be easily and is more frequently expressed in adjectival form. The subject is capable of wide extension thanks to the power of the language, where a thing is not a convenient subject, a place or time may be converted into one. But the subject must either be individual² or a class denoted by a class name and capable of being considered as a single object. If a number of things do not form a real class³ there cannot be any single judgement about them, there can only be a series of judgements arising from a series of independent inferences regarding each individual.

An inference, again as we have seen must correspond to reality, and there can be no formal correctness, as opposed to real representation of truth. Thus demand excludes partial or in the school terminology contingent (*anupadhika*) judgements, which would not correspond to

¹ Jacobi *AGWG* 1901 p. 470, says in the fourth and fifth members but this would give a negative conclusion cf *Āśāra* pp. 7, 108, 110 *TR.* pp. 70-71. The negative form is sometimes adopted however, e.g. *TB.* p. 39, cf *ĀBh.* p. 43 Colebrooke, i 315 316 *Padārtha rat namālā* p. 64

² *AS.* ii. 2 66.

³ Below ch. vii § 3.

reality for in the Nyaya view the knowledge that some S is P is not true knowledge which would require a knowledge of exactly what S were P

The similarity of the syllogism of the Nyaya to that of formal logic is as obvious as the dissimilarity,¹ and the cause of the difference is plain. The Nyaya syllogism represents the form developed in discussion. The proposition which heads it represents the starting point without something to represent the object of a desire (*abhiseka*) to obtain information no discussion can begin. The reason is the answer to the question why the proposition is asserted. the example, or rather the statement of concomitance, replies to the question why the reason is sufficient to produce the conclusion. the general statement being made clear by an example. It remains then only in the two last members of the syllogism to apply the general rule to the particular case and then to express the conclusion which thus appears at the end of the syllogism not as a mere idle repetition but as the assurance of a reasoned conclusion. What is remarkable however is the fact that the example remains almost to the last an essential part of the system indeed in practice it is the example which is given rather than the formal statement of concomitance. it remained for Laugakṣi Bhaskara in his comment the *Nyayasulwantamanyari praloca*² to say that the use of the example is conventional and not essential.

While in practice the Nyaya syllogism is frequently reduced to the first three members the third in the mere form of the example as in 'The mountain has fire because it has smoke like a kitchen', the Mimamsa formally reduces the number to three namely the first set of three, another view accepted the second third

¹ Athalye TS pp. 236 ff. 265 ff

² Ibid p. 281

and fourth members as adequate while the Vedānta was satisfied either with the first or the last three¹. The later Buddhist view accepted as necessary only the third and the fourth (*udāharana* and *upanaya*) Dharmakīrti's² view differing from that of Dignaga,³ treats the proposition and the reason in which the example is included as sufficient for inference. The Vaiśeṣika agreed with the Nyāya though the tradition of the distinguishing names given by Praśastapada was preserved.

5 *Analogy or Comparison*

The Nyāya school⁴ and the authorities of the Nyāya-Vaiśeṣika with the exception of Ācārāditya treat analogy or comparison (*upamāna*) as a third means of proof, the establishment of something unknown through its similarity to something already known. The stock example of the process is already given by Vatsyayana, a man who has never seen a buffalo is told by a forester, who as an expert is worthy of credence that it resembles a cow. On entering a woody region he sees a strange animal whose shape reminds him of a cow, and there comes to his remembrance the name buffalo taught by the forester. The essence of the process involves both the knowledge imputed by the forester, and the perception of similarity in the object presented, and there is a direct divergence of opinion between the ancient and modern schools⁵ on the part played by these two factors

¹ VP, p. 14. TC ii 689n. PSPM, p. 49. CD, p. 44.

² NB, p. 118, cf. NBT., p. 90.

⁵ NKeśa, p. 147, the first view in NB, pp. 21-22 the latter NV, pp. 60-61, NSM, pp. 20-3 follows NBh.

in the production of the result. The older view holds that the immediate cause of the knowledge obtained by comparison is the verbal knowledge given by the forester, while the perception of resemblance is but an accessory cause of the result. The modern school inverts the relationship, thus laying greater emphasis on the similarity which lies at the bottom of the process but without fundamentally altering the view of the process. Similarity, however is not to be deemed the only cause of knowledge of this kind, dissimilarity or a peculiar property may serve the same end: thus a man may recognize a camel because, unlike a horse it possesses a humped back and a long neck or a rhinoceros by the single horn which adorns its nose.

There is disagreement also between the ancient and modern schools as to the precise nature of the judgement in which the process of comparison results. The older view, held also by Keçava Miçra, Laugakṣi, Bhaskara and Annam Bhatta, gives the judgement as an assertion that the animal perceived bears the name buffalo. The more recent opinion of Viçvanatha treats it as a recognition that the thing seen is an individual of the species buffalo, and this accords with the fact that the result of the experience is to enrich the subject of the experience with the recognition by its name of a new animal species.

The weakness of the Nyaya concept was not ignored by the rival school. Vacaspati Miçra¹ in expounding the Sāṃkhya doctrine which does not admit comparison as a separate means of proof analyses the process and proves that there is nothing permitting of the setting up of comparison as a special means of attaining knowledge. The instruction of the forester falls in the sphere

¹ *Sāṃkhyasūtravārtikā* m. d. 5 of PSPM p. 69

of verbal knowledge¹ as a means of proof, similarity is recognized by perception and inference accounts for the rest. The Vaiśeṣika school include comparison in inference² the syllogism runs 'This object is to be styled buffalo, since it is like a cow and whatever is like a cow bears the name buffalo'. The reply of the Nyāya³ is an appeal to experience which shows that in ordinary life judgements of comparison are formed without going through the process indicated a reply which shows a complete inability to distinguish between a logical and a psychological analysis, and to the conservatism of the Nyāya rather than any other cause must in all likelihood be attributed the maintenance even in the latest state of the school of a distinction between inference and comparison as fundamentally different modes of proof. The whole subject receives elaborate discussion by Udayana⁴ who rejects the Vedānta and Mīmāṃsā defence which regards the instrument in comparison as the cognition that this animal is like a cow and the conclusion as the judgement 'The cow is like this buffalo'. He defends comparison on the ground that it implies more than verbal testimony which only teaches us that the term 'buffalo' is applicable where likeness to a cow is found. Comparison on the other hand gives us the knowledge that the term 'buffalo' applies to a species which we comprehend from perceiving a specimen in quite a different manner from our previous knowledge based on verbal testimony. Comparison therefore teaches us the direct signification of a word. It does not teach anything about the existence or non existence of anything. Hence

¹ In VSara pp 30 2 272 37 it is reduced to verbal testimony

² VSU ix 2, 5

³ A lakṣaṇa p. 116.

⁴ Kus iii 8-12 cf TC iii 40 ff. TR pp 374 the Mīmāṃsā (PSPM, p 68) makes likeness a separate category a view refuted both in SS, v 94-6 and by Kumārila

if there is an attempt to prove the non existence of a creator by the comparison. Whatever is like the omniscient individual soul is not omnipotent and this being which is like the individual soul is what is meant by the name God. the reply is that the use of comparison as means of proof in this way is invalid.

In the *Nyaya Sutra* ¹ itself the case for comparison is defended against a difficulty made as to the possibility of argument from mere similarity by the statement that the reasoning is based on recognized and patent similarity. Against the argument that it like inference, leads to the establishment of what is not perceived by means of what is perceived it is urged that it is the perception of the buffalo which leads to the result of the comparison, and that the verbal expression of a comparison diverges from that of an inference whence the difference of the things follows.

CHAPTER IV

LOGICAL ERRORS

1 *The Origin and Development of the Doctrine of Fallacies*

THE treatment of fallacies in both the *Nyaya Sūtra* and the *Vaiśeṣika Sūtra* is brief and simple standing in curious contrast to the elaboration of this topic by the later texts. Fallacies rank as one of the categories of of Gautama,¹ but in accordance with the lack of development of any theory of the true nature of inference there is no attempt to explain the reasons underlying the classes of fallacies enumerated. Naturally enough, the commentators find in the list the prototype of the scheme which they recognized in the contemporary syncretist school but it is difficult to believe that this view had any legitimacy. Of the list of five given the first and second alone are named with familiar terms. The first is *saṃyajhikāra* discrepant, which is defined as a reason which leads to more conclusions than one (*anāikāntika*) and this definition applies to the form of fallacy throughout its history. The second is the contrary (*viruddha*) which is marked by the fact that the reason leads to a result opposite to that which is established, and it also—though with change of sense—passes into the later terminology. The third *prakaraṇasama* seems by its literal sense 'equal to the question', to mean a reason

which provokes the very question which it was intended to answer, the later view classes it as equivalent to the counterbalanced reason (*satpratipakṣa*) but with doubtful propriety, for it may equally well be equated to the contradicted reason (*bādhitā*) or more probably differ from either.¹ The third form styled equal to the conclusion (*sādhyasama*), is explained as one in which the reason is as much in need of proof as the conclusion later it is classed among the unreal reasons (*asiddhā*). The last is that for which the time has gone by (*kālatīta*) on one interpretation which Vatsyayana rejects it applies to a fault in the form of the syllogism when the reason is adduced in the wrong place in the order of propositions. This interpretation however is open to the objection that mere formal order is not essential to the meaning of a Sanskrit sentence and that the misplacement of any member of the syllogism is described in the Nyaya as falling under a special form 'the untimely' (*aprapta-kāla*) of the category styled 'Occasions for Rebuke' (*nigraha-sthāna*).² The accepted explanation,³ however is hardly easy to believe. It is based on the view that an effort is made to argue the abiding character, and therefore eternity of sound from the fact that it is manifested by union (e.g. between a drum and the rod) just as colour, whose existence is admitted is manifested by union with light. The fallacy lies in the fact that the manifestation of sound is not due to the union but takes place at a subsequent moment (*kālatīta*) after the union has ceased. The later doctrine forces it into the category of contradicted reason but manifestly without plausibility. Indeed in no part of Gautama's

Cf NBh. p. 33. N\ pp. 1 & 16.

² NS v. 11.

³ NV p. 17. NBh. p. 54. N\ T. gives the later view that it is *bādhitā*.

system is there more clear proof of the lack of an authentic tradition of his meaning unless perhaps in the confusion as to the significance of the three kinds of inference which he recognizes

The case with Gautama is very different from that with Kanada¹. The doctrine of Kanada as now restored to the text of the Sūtra is perfectly plain. It states a definition of a fallacious reason or non reason (*anapa-
deṣa* in his terminology in which *apadeṣa* replaces *hetu*) as that which is unproved (*aprasiddha*) that is which is not shown to be in invariable concomitance with the consequence. Of the fallacious reason two species are mentioned the unreal (*asat*) and the doubtful (*saṃ-
digḥa*), which correspond accurately enough to the later *asiddha* and *śaṅkabhāva*. The examples given are for the unreal the argument. Since it has horns it is a horse. for the insufficient² reason. Since it has horns it is an ox. A horse of course is not horned but there are other animals besides an ox which are so adorned. As the traditional text stands this clear outline has been brought into confusion by an interpretation which may probably enough be little if at all anterior to Prāsaṅgika himself³.

2 *Dignāga and Prāsaṅgika*

The evidence already adduced in the account of the development of inference gives ground to suppose that Dignāga can claim to have enunciated the principle of invariable concomitance as the fundamental principle of the syllogism. The investigation of this question

¹ iii 1 1-1"

² *anābhāṅga* evidently = *śaṅkabhāva*

³ *aprasiddha* *anapaṭyākṣa* *asau* *śaṅkabhāva* ca is the original text, Prāsaṅgika (p. 201) read it as one Sūtra.

inevitably led to the exposition of the conditions which must mark the middle term if it were to serve the purpose for which it was destined, and the *Nyāyapratiśeṣa*¹ lays down the three essential conditions in explicit terms. The whole of the subject must be connected with the middle term, all things denoted by the middle term must be homogeneous with things denoted by the major term, none of the things heterogeneous from the major term must be a thing denoted by the middle term. Dharmakīrti in the *Nyāyabindu*² reproduces the same rules for the three characteristics of the middle term, it must exist in what is to be inferred (*anumejje satvram eva*), it must exist in things only which are homogeneous with the major term (*sapakṣa*), and it must not exist in things heterogeneous with the major term (*vipakṣa*). The division of fallacies in both is based on the principle that if one or more of these rules is violated, there arises a fallacious reason. Three classes of such fallacies are recognized by Dignāga the unreal (*asiddha*), the indeterminate (*anānantika*) and the contrary (*viruddha*) as they are styled by Dharmakīrti who follows with modifications and improvements the scheme set out by his predecessor. Four subdivisions of the unreal reason are recognized when the unreality is recognized by both parties to the discussion, when it is conceded by one party only, when its reality is called in question, and when it is doubtful whether the middle term can be predicated of the subject. Of the indeterminate there are six forms when the middle term abides both in the major term and in the opposite, which is the too general middle term of later logic (*sadharana*), when the middle term abides neither in the major nor its opposite the too restricted (*asadharana*) form of later logic, when the

¹ *Med. Lej.* pp. 33 ff. N. 17 58 59

² *NB*, p. 114 ff., *SDS* 1 pp. 44 6

middle term abides in some of the things homogeneous with and in all of the things heterogeneous from the major term, when the middle term abides in all the things homogeneous with and some of the things heterogeneous from the major term, when the middle term abides in some things homogeneous with and some heterogeneous from the major term, and lastly the contrary but not discrepant (*vaidharīyabhicārin*) middle term that is when a thesis and its contradictory are both supported by equally valid reasons. The stock example of the last is the argument adduced by a Vaiśeṣika to prove that sound is not eternal because it is a product while the Mīmāṃsā responds that it is eternal because it is audible. Finally there are four¹ subdivisions of the contrary, according as the middle term contradicts the major term or the implied major term or the minor term or the implied minor term. Of these the fallacy which is contrary to the implied major term is akin to the contrary but not discrepant, since it depends on the fact that it is contrary to a principle of the school by which it is used and it is therefore termed that which cuts across one's principles (*istatighātakatā*).² The example given by Dignāga is the argument that the eyes &c. are of service to some being because they are made of particles like a bed seat, &c. Here the major term 'of service to some being' is ambiguous its apparent meaning is 'of service to the body', but the implied meaning is 'of service to the soul'. But the Sāṃkhya system holds that though things made of particles are of service to the body they are not of service to the soul which has no attributes. Hence the middle term contradicts the implied term as understood by the Sāṃkhya.

¹ Kumārila ५४ Pl. 190 " clearly refers to this view and the
² ५५ अत्र

Dharmakīrti¹ presents us with the same classification but with a diminution in the subdivisions. The four of the unreal reasons remain but of the indeterminate only the first two are kept the too general and the too restricted and the contrary likewise is reduced to two varieties depending on the fact of the existence of the middle term in what is heterogeneous from the major or its non existence in what is homogeneous with the major. It is of interest that he recognizes and disallows the two varieties of contrary but not discrepant and that which cuts across one's principles. The former he holds not to concern inference at all as it arises from the fact that the two different sides in such a case rest on the authority of scripture and this is for him as in theory it was for Dignāga no true source of knowledge². The latter he dismisses because it is included in the general conception of contrary which indeed in the definition of Gautama is that which is contrary to the principles admitted by the reasoner³.

In the case of Praśastapada the question is complicated by the existence of the *versus memoriales* which he cites as embodying the views of (Kanaḍa) Kaṣyapa and in which the division of fallacies is based on the conditions for the correctness of the reason for inducing proof. They⁴ run: That mark is the means of inference which is connected with that which is to be inferred is known to exist in that which is accompanied with that

which is to be inferred and does not exist at all where that does not exist. That which departs therefrom in one or two points is declared by Kaśyapa to be no reason is contrary, unreal or doubtful. The similarity of the statement of the three conditions (*traiūpya*) of the middle term to that in the Buddhist formulation is obvious but it is important to note that the parallelism is not complete as regards the first essential condition. In the case of the Buddhist formula this condition is stated as the connexion of the middle term with the subject (*anumeṣa*) the sense of the latter term being made clear by its definition in the *Ayayabindu* as the thing possessing an attribute (*dharma*) whose peculiarity is to be known (*gyana ita viśeṣa*)¹. It is natural to read the same meaning into the *versus memoriales* and this has been repeatedly done² but only at the cost of complete disregard of the language. While that which is to be inferred (*anumeṣa*) can like *sādhyā* in its earlier sense denote the subject of the inference it equally easily and naturally like *sādhyā* is employed of the conclusion and that this is here the sense is proved by the expression which is to be accompanied by that 'for the that' (*tad anuṣṭe*) can only refer to *anumeṣa* which precedes it and it is of course common ground that the characteristic of the similar instance (*sapakṣa* in the *Ayayabindu* here *tulanuṣṭe*) is to present the major and middle terms, not the middle term and the subject. The apparent objection that thus the reference to the subject is omitted must be recognized but the remedy is not to read³ into the verses

¹ NB. p. 104. This view as in D. g. n. 2 is controverted in NY pp. 52 & where (p. 100 PBL p. 200 seems to be referred to D. g. n. 2's own case is given in *Andrikāra* 104 J1 p. 13. Cf p. 101, n. 2.

the qualification that the first condition connexion with the conclusion is to exist in the subject, which of course begs the question. The Vaiśeṣikas deliberately adopted the view that the knowledge of the middle term was the proximate cause of inference, and were criticized by their opponents precisely because thus they failed to emphasize the element of existence of the middle term in the subject. The explanation of their attitude is perfectly simple: the three conditions as set out represent a precise statement of the third member of the syllogism, the example (*udāharaṇa*) when completed as it was in Piṅgastipada's time by the enunciation of the general proposition. Of the first part of the example we have a reflection in the first condition: the invariable concomitance between the middle term and the major term between smoke and fire.

Where there is smoke there is fire, the second condition corresponds to the affirmative example of the concomitance of smoke and fire as in a kitchen; the third with the negative example of the absence of smoke when there is no fire, as in a lake. The reference to the subject is of course implicit: the conception of a middle term is essentially relative to a subject on the one hand and a major term on the other. In the Buddhist formulation in its turn there would be inadequate reference to the invariable concomitance as a principle if it were not that the middle term is essentially relative to the major and is related to it in the view of Dharmakīrti by way of identity, cause and effect or non-existence. The divergence of emphasis however, is very far from diminishing the probability of borrowing on the part of the Vaiśeṣika: it is in entire accord with the natural wish of a school, when it has to appropriate fruitful ideas from another to disguise and adapt them in form if not in substance.

The impression of borrowing is confirmed by the fact

that Praçastapada or some predecessor, if we admit that the *versus memoriales* were really composed before him thought it necessary to remodel the text of the *Vaiçeṣika Sūtra* in order to bring the new doctrine into harmony with the accepted text. The correction was ingenious: the two aphorisms of the original text which as we have seen defined fallacy and set out two classes, were combined into a single clause and read as giving the varied classes of fallacies. But the complication did not end there, for it was not sufficient to Praçastapada to establish three classes of fallacies: he had to assume that the enumeration gave room for the four classes which he himself accepted. The terms of the text as changed gave the old classes of unreal (*asat*) doubtful (*sandigdha*) and also *aprasiddha*, a new term while the *versus memoriales* gave *asiddha*, *viruddha* and *sandigdha* and Praçastapada added the *anadhyarṣita* or void reason. To effect a harmony between these views and the Sūtra Praçastapada¹ declared the identity of *aprasiddha* with *viruddha* and his new addition regardless of the utter violence he thus did to the text. A later hand² endeavoured at least to avoid the incoherence thus created in the Sūtra by the interpolation of a word at the end of the second of the two aphorisms which Praçastapada read as one: the text thus gave once more two clauses but in lieu of a definition of fallacy, followed by an enumeration of two classes we have first the statement that the *aprasiddha* is a fallacy, and then that the unreal and the doubtful are fallacies, the absurdity of which is self evident.

Praçastapada³ himself gives in prose practically the

same account of the conditions affecting the reason or middle term the mark must be associated in respect of time or place with the thing to be inferred be found in all or one case where the attribute to be inferred is present and be proved to be non-existent in everything opposite from what is to be inferred. The slight divergence of wording brings out clearly the essential realism of the system the reason is a reflex of reality. At the same time the wording confirms the view that the first condition refers to the relation of middle term and major not of middle term and subject the thing to be inferred is the fire on the mountain not the subject which is not a thing to be inferred but a thing whose attribute is to be inferred from the mark. In the second condition a new element appears which forms also the subject of observation by Uddyotakara in his examination of the formulation of the subject of the three conditions of the reason by Dignaga it is expressly recognized that the extension of the middle is not equivalent to that of the major fire may exist without smoke. Thus point the earlier formulation ignored for the simple reason that it was irrelevant to the business in hand the third member of the syllogism must give an affirmative example, and it is irrelevant to note that the major may exist without the middle term.

On the basis of the threefold conditions of the reason Piṅgastipada bases his division of fallacies departure in one or two points brings about the invalidation of the reason to attain the conclusion just as in the Buddhist view. Moreover the divisions of the unreal reason are similar to those which were already given by Dignaga from whom he doubtless borrowed them¹. But in the other categories there is a significant variance which can

¹ Stcherbatsko *MUSEON* v 168 148 58 co 17, Faddegon p 302

which the middle term is present neither in the major term nor in its opposite. The stock example is the reasoning: Sound is eternal, because it is audible. Dharmakīrti¹ however, classifies in the same count the argument which the Nyāya and Vaiśeṣika accept, *Living* bodies have a soul, because they have animal functions, which the later theory makes an inference with purely negative concomitance (*śeṣa vyatirekin*)². It is not certain how far Praçastapada would have accepted the classification of these two kinds under the same head for, though he does not actually recognize the classes of purely positive and purely negative inference he appears³ to admit the truth of the argument: Sound is a quality, because it is audible, or: Sound differs from other things because it is audible. The distinction between the two instances is plain: in the first the major term *eternal* is wider in extension than the subject and the middle term which are of equal extension sound alone being audible, in the second, the three terms are all of like extension and in the later view at least the conclusion is legitimate. Whether in any case the too restricted reason is deemed doubtful or void seems little more than variation of terminology designed to mark the independence of the new writer. The distinction is the more noteworthy in that Praçastapada himself records an objection to this view in the fact that *Kanada*⁴ in treating of sound appears to have reckoned the too restricted reason as a source of doubt although Praçastapada has not much difficulty in explaining away this seeming obstacle to his theory. It is in keeping with his determination to avoid too close

Laugakṣi Bhaskara more generally as that which is the object of a knowledge which renders impossible the inferential judgment or the process which leads up to it the latter phrase being wide enough to cover what is held on any of the theories to be the proximate cause of inference whether knowledge of the middle term knowledge of the concomitance or the reflection (*paramāṇa*) Annam Bhatta¹ insists on requiring that the knowledge should be correct since otherwise in the familiar reasoning *The mountain has fire because it has smoke* a fault might be suggested through the erroneous perception of the absence of fire on the mountain

The classes of fallacies are also increased to five an artificial symmetry designed doubtless to imitate the Buddhist system which recognizes three conditions and three sets of fallacies Presumably the increase in the number took place first in the classification of fallacies and thence was extended to the number of conditions The five classes are in the order of Gaṅgeśa² the discrepant (*svyābhāsa*) which is also styled indeterminate (*anāikāntīka*) the contrary (*viruddha*) the counter-balanced (*satpratipaksa*) the unreal (*asiddha*) and the contradicted (*bhīṭa*) but they may be examined in the order of the Buddhist list with the addition of the two new members of the series

I The indeterminate or discrepant³ which is styled in the Vaiśeṣika terminology the doubtful (*sandigdha*) lies in the fact that one or both of the second and third conditions is violated whence the conclusion ceases to

possess any certainty and remains therefore an object of doubt. It falls into three species

(1) The too general reason (*adharana*) is found not only in the similar instances but also in the opposite instances. the possession of horns does not make an animal an ox nor has the mountain fire because it can be known

(2) The too restricted reason (*asadharana*) on the other hand offends against the second condition for it occurs nowhere outside the subject itself. Its absence from the opposite instances or counter examples tends to establish the validity of the conclusion but its absence from the similar instances or examples tends to invalidate the result which remains therefore a matter of doubt

'Sound is eternal because it is audible' is the standing example, as we have seen the fallacy is distinguished in the modern school from the purely negative inference by reason that in the fallacy the major term has greater extension than the other terms while in the inference which is valid all three terms have the like extension

(3) The reason which does not subsume (*anupasan harin*) is that which is alleged of a subject which is so extensive as to permit neither of examples or counter examples as in 'All is eternal because it can be known. The nature of 'all' forbids the possibility of any universal concomitance and thus prevents either the second or the third of the conditions being complied with. Or equally well the opposite argument can be used 'All is transitory because it can be known. The modern school¹ object that the individual things of this world might serve as examples and therefore define the fallacy as one in which there exists only a positive connexion between reason and consequence a definition which is open to the

¹ Athalye TS pp. 303-304

retort that it covers the case of the purely positive inference which the modern school accepts as valid as does the older school, as in 'All can be named, because it can be known'. There exists, however, a clear difference between the last proposition and those quoted to illustrate the fallacy: in the latter there is a real ground of connexion between naming and knowledge, in the former it is not so, and the test of reasoning is always in the school correspondence with reality.

II. The contrary reason (*viruddha*)¹ is one which serves to prove exactly the opposite of the thesis it is adduced to establish. It thus does not exist in examples, but does exist in counter examples, and so violates the second and third conditions alike. Sound is not eternal, because it is a product, nor is an animal a horse because it has horns.

III. The unreal reason (*asiddha*)² falls into three species in accordance with the three factors involved in the reflection (*parāmarṣa*) which brings about inferential knowledge, the subject, the relation of the middle term

¹ SP, § 159, TC, 1 842-64, TA., p 19, TB, pp 44, 107, 108; TK, p 14, TS, § 54, BP 74, NSāra, pp 7, 9, 119-23, gives eight varieties, TR., p 224, gives the same definition as NSāra and TB. In NB, NV 1.2 6, it still is really a *badhita*, the new sense is in NVT.

² SP, § 158; TC 11 897-937, TA., pp 19, 20, TB, pp 42-4, 102-6, TK., pp. 14, 15, TS, § 56, BP 75-7. NSāra, pp. 7-9, 118-9, gives fourteen divisions (twelve in commentary) defining it as *anupatapaśaerthi*, TR., pp 223-8, follows Udayana's *Lakṣaṇamālā* (according to the commentary) in the threefold division, but adds a fourth class of *ajñānāsiddha* (in three varieties) and mentions five of Bhāsarvajña's as subvarieties. Both record the more general divisions of *ubhayaśiddhī* and *anyatārāśiddhī*. NV., p. 177, has a triple division with divergent names for (2) and (3); but NVTP recognizes the new names, while NVT has four classes (*svarūpa*, *ekadeśa*, *ūpaya*, *anyathā*); PBp, p. 238, has *anumeṣa*, *tadbhāva*, and two varieties of what is equivalent roughly to NB., p 112, 11 2-7, where three varieties occur, NB has also *dharma*- and *sand g thās dāha*.

There are two forms of this class in the first the concomitance simple does not exist, in the second there is concomitance but only a conditional (*upadhika*) one which is of no value for inference. In the first case we have such inferences as 'The mountain has fire because it has golden smoke', for the addition of golden destroys the concomitance since golden smoke does not, in the Indian view, exist.¹ Even if we substitute black for golden the older school denies the validity of the inference, though the modern school admits it, apparently on the ground that otherwise it might be thought that the quality black formed a necessary part of the concomitance which is between the smoke and fire as such. More interesting is a third example the reasoning 'Sound is momentary, because it exists', which represents the Buddhist view is rejected because it involves the proposition that all which exists is momentary, and the Nyāya Vaiśeṣika insists that a sound lasts for three moments that of its production and that of its destruction with that intervening between them.

The conditional concomitance² is illustrated by such a case as the argument, 'The mountain has smoke, because it has fire'. The proposition is conditioned by the fact that there is no universal concomitance between fire and smoke, but only between fire produced from wet fuel and smoke. Laṅkāra Bhāṣaka and Annam Bhaṭṭa treat this as a fallacy, and indeed Annam Bhaṭṭa's definition of the third form of the unreal reason seems strictly speaking to cover the conditional concomitance only. On the other hand there exists a view which declines to accept such a case

¹ On *upadhikā* see TC. II. 294-406; TR. pp. 43-44, 106; Th. pp. 17-18; TS. II, § 56, BP 133-40. VSU II 2. 14. TR. p. 17. Max Müller's view (*op. cit.*, p. 170-172) is clearly wrong. Cf. NQM pp. 110-12.

as fallacious since it does not fulfil the requirement of a fault in reasoning, namely that it should prevent the taking place of the reflection (*parimāṣa*). In truth if the condition is borne in mind it is possible to reason accurately. Thus we can reason correctly, 'If the lightning were to fall on a heap of hay, it would give out smoke', since in such a case the condition for the truth of the concomitance would actually be verified. This is an interesting example of the effort to extend the process of inference beyond the bounds imposed upon it by the demand that nothing save an absolutely universal concomitance should be taken as a basis of reasoning.

IV The counter balanced reason (*atpratipakṣa*)¹ is one for which there exists another reason which proves the contrary of the consequence. The later texts apply to it also the term *prakaraṇasama* taken from Gautama equating the two ideas by interpreting the *prakaraṇasama* as a reason which, though intended to give a certain proof, leaves us with the desire for an argument to establish the conclusion and hence is called 'like an argument' (*prakaraṇasama*). This form of reason differs from the contrary, because in the latter the reason in itself proves the opposite of what was intended, while in this case the reason is simply rendered inconclusive by the existence of an argument opposed to it of equal weight. In the contradictory reason (*badhita*) again, the consequence is in flat contradiction with the truth and thus contradiction may be proved not merely by argument, but by direct perception or other recognized

¹ SP, § 163, TC II ५७ १७, TL, p. 19. TL, pp. 44, 45, 108, 109. Th., p. 14. TS, § 5. BP 7, the view of Nāgārjuna pp. 12, is refuted in TR, pp. 221-3, when the *śraddhārgaḥśāra* appears as a variant of this form, while Bhāsarvajā seems to reduce it to an *anya-arasiddha* (otherwise the commentary, pp. 133-5). The identification with *prakaraṇasama* is in Aṣṭaśāstra 2, 9.

means of proof. Again, to make this case of fallacy there must be equal weight in the two reasons which can be opposed in the triple division suggested by Keçava Miçra the first two cases where the first or the second is of prevailing weight cannot be properly reckoned here. If there is scriptural authority for either argument, it must prevail and the reason would become not counter balanced but contradicted.

V A reason is said to be contradicted (*badhita*)¹ in the definition of Keçava Miçra when by means of another proof perception or otherwise, it can be established that there is present in the subject the negation of the consequence which the argument is intended to establish. It can be illustrated therefore by such a proposition as

The fire is cold because it is "a substance, like water while for the counter balanced reason we must have resort to such arguments as 'The mountain is fiery because it has smoke' opposed to 'The mountain is not fiery because it is bare rock.' With the contradicted reason the later school identifies the *kālatita* fallacy of Gautama on the ground that it is inopportune and intempestive (*kālatita*) to adduce a reason of this sort to prove a conclusion which other evidence has already established the contrary conclusion.

From this general classification and description none of the syncretist writers departs in substance though Keçava Miçra omits entirely the non subsuming variety of the indeterminate reason. Çivāditya² however increases the number of classes to six by accepting as a separate class the void reason (*anadhyatita*) of Praçastapada which he defines much as in that writer

¹ SP § 167 TC II 933 S° TA p 90 TB pp 44 45 109 110 TK p 15 TS § 67 BP 78 NSāra pp 7 11 TR pp 99 31

showing that at his early date the fusion of the Vaiṣeṣika views was not yet completely carried through. The earlier Vaiṣeṣika too had not recognized the classes of counterbalanced and contradictory reasons as such. Čankara Miçia¹ tells us that they were interpreted into the text of the Sutra by a Vrttikara or writer of a commentary, but the identity of this author is wholly unknown. There is of course a rough distinction between the new classes and the old but it can hardly be contended² that the Vaiṣeṣika school acted on an attempt to distinguish between formal and material fallacies in omitting them for, as we have seen there were approximations to these classes in the classification of Praçastapada. Thus the contradicted reason figures in Praçastapada as part of the contrary (*viruddha*) in the shape of the reason contradicted by the text of the school (*agamabadhita*) and this can be traced further back to the antinomic reason (*viruddhāyabhuvarin*) of the Buddhist logic. The counter balanced reason (*satpratipakṣa*) again figures with Praçastapada as part of the void reason (*anadhyayasita*) and again can be traced to the antinomic head of the Buddhists. Nor in truth is it really possible to attempt a serious distinction of formal and material in fallacies, since the Indian logic is never formal but always realistic.

It is characteristic that there should have been made a serious effort to induce the categories set up by Gūtama to enter into the new division nor is it at all unlikely that the fivefold classification was stereotyped precisely in order to suit the fivefold classification of the *Nyaya Sutra*. The efforts to equate *prakaranasama* and *satpratipakṣa*, *kalatita* and *badhita* have been mentioned, the compilers ignored the fact that Gautama's

¹ VSU iii 2 17

² Ati alye TS p 300

contrary (*viruddha*) is really equivalent to contradiction by scripture (*agamabadhita*) or Dignāga's *istavighatakt*, and equated it with the later *viruddha*. The *sādhya sama* was equated with the unreal reason,¹ but the divisions of that head may be traced in part through Praçastapada to the Buddhist logic though the details are dubious.²

4 Other Logical Errors

On the theory of the Buddhist logic a train of reasoning is fallacious not only if the middle term is defective but also if the subject matter or thesis cannot be sustained that is if it is refuted in advance by the proof of the opposite or if the examples which serve to show the correctness of the middle term are not valid being badly chosen. On this basis are set up fallacies of the thesis (*grāsabhasa*) and fallacies of the example (*distantabhasa*) details of which we have both from Dignāga³ and from Dharmakīrti.⁴ It is significant that Praçastapada⁵ accepts the whole theory, and follows closely the Buddhist model even to the extent⁶ of closely copying but with characteristic variation of phraseology the description given of the defective thesis. The doctrine

¹ NV p 177

⁴ NB pp 111 116 ff

⁵ pp 234 ff 247 ff

⁶ *as rohi* (p 231) replaces *an rūkṣa* NB, p 110 Stcherbatskoj *Museon* v 158 Dignāga's definition (cf NV, pp 119 120) was *sādī jātvenepalāh pakṣaḥ viruddhārth an rūkṣa* the last half being condemned by NV. Subandhu (not Vaubandhu) seems to have defined it as *pakṣo yaḥ sādhyatam is'at* (NVT, pp 184 186). Gangānātha Jha's view (NS i 441 n., 451 n.) that he is the author of the *Vadavidhāna* (NV pp 120 156) is improbable in view of the positive evidence of the Tibetan trans. JRAS 1914 pp 601 602

however, is foreign to the Nyāya¹ or the Vaiśeṣika or to the combined school, and only the Jains² agree with the Buddhists and Praçastapada in recognizing it. The reason is clear — as Uddyotakara³ and Vacaspati Miśra⁴ plainly say, if the theses are to be deemed as in themselves true or false, there would be no purpose served in recourse to the middle term and an examination of the fallacies adduced in the Buddhist school shows that the division involves useless repetition. Vatsyayana and the schools after him accept clearly the doctrine that the thesis is neither true nor false in advance, it is a subject of doubt which is resolved by the use of the middle term, or, as Annam Bhatta⁵ has it, the subject (*pakṣa*) is that which possess the conclusion in a doubtful form (*sumatigdhasadhyayin*). So little, indeed, did Praçastapada impress the doctrine he had borrowed on his school that Vacaspati Miśra⁷ ascribes the fallacies of thesis and example to the Buddhists without hinting that he knew that Praçastapada himself had adopted the principle. The possibility of borrowing⁸ by Buddhism must therefore be entirely negatived⁹.

On the other hand the syncretist school¹⁰ treats errors in the definition (*lalāṣṇa*) as being closely connected with errors in the reason or middle term. A definition may be too general (*ativyāpti*) and include the characteristics which are found in other things than the subject of the definition as in 'The cow is a horned animal'. This form can be compared with the unreal reason in respect of concomitance (*vyāpyatāsiddhi*) or

⁹ Stecherbatskoi *Muséon* v 150 8

¹⁰ TB, i p 110, 111, TA, p 21, TSD, § 3

the too general form of the indeterminate reason. Or a definition may be too narrow (*avyāṇti*) as when a cow is defined as tawny, and other coloured cows are excluded. Or the definition may be impossible (*asambhava*) as when the cow is defined as whole hooved, both this and the preceding being varieties of the unreal in respect of the substratum. A correct definition is negatively defined as one which is free from any of these three faults and more positively by Vatsyayana¹ as an attribute which differentiates what is defined from all things other than itself. This characteristic results in the definition of the schools being largely reduced to the statement of the specific difference possessed by any thing and in many cases definition takes place by negation of certain attributes within a wider conception.²

In addition to fallacies Gautama devotes three other categories to logical errors but the later texts treat them with as scanty consideration as they deserve. The first is the fraud or cheating (*clāṣa*) which consists merely in the giving of false interpretations to the words of an adversary in discussion. The forms of this device are three: a word may be understood in the sense which appertains to another word of the same form as for instance *nava* may be meant as new and interpreted as nine. Or the word may be given too wide a sense (*śamanyacclāṣa*) or a metaphorical expression may be interpreted literally (*upacāyacclāṣa*).³

The second class consists of futile objections (*jāti*)⁴ of

¹ NS i 1 1

² TR, pp 75-6 shows that a definition is really a purely negative inference.

³ NS i 2 10 1 with commentary NSāra pp. 16 17 161 6 TB p. 111 TSD § 81 GSAI xix 342ff NSāra pp. 16, 17, 161 6 TR pp 239-46

⁴ NS v 1 NSāra pp 17 93 167 91 TB pp 111 112 TSD § 81 SDST, pp 81 7 TR, pp 247-317

plea of business or admit a defect on his own side while criticizing one on the other, or fail to censure an error or censure what is correct or depart from a tenet which forms the basis of reasoning (*aparasuddhanta*) while the fallacies proper are naturally included as a specially appropriate occasion for rebuke

These miscellaneous classes have it is clear, for the most part but little direct connexion with logical errors, and fall rather within the sphere of dialectic. Strictly logical are only such cases as those of inconsistency with the proposition in its various aspects or the shifting of the reason enunciated in the second member of the syllogism by the use of a different reason in the third member. In cases such as the *regressus ad infinitum* (*anavastha*) the reasoning in a circle (*cakraka*) the *ignoratio elenchi* (*atmaṣṭaya*) and others¹ the errors which occur can be regarded as series of syllogisms partly invalid. Nor is it difficult if it were worth while, to show that the various sorts of logical errors can be reduced to the violation of one or other of the five conditions laid down for the correctness of the middle term.

From the Nyaya school it is at least probable that the other schools borrowed their criticism of invalid reasoning. It is true that the claim has been made by competent authority² that the conception of the *regressus ad infinitum* as a means of argument is to be referred to the Sāṃkhya school. But already in Gautama³ the principle is adduced in the discussion of the indivisibility of atoms to which exception is taken on the ground that if each atom is capable of division the process will continue *ad infinitum* which involves a *regressus ad*

CHAPTER V

THE NATURE AND AUTHORITY OF SPEECH

1 *The Nature of Speech*

THE recognition by the Nyaya and of the syncretist school save Çivāditya of verbal knowledge (*śabda*) as a means of proof imposed upon them a careful survey of the nature and origin of language in which however their freedom of thought was strictly limited by the presuppositions which they inherited. Each word has they hold ¹ a significance (*śakti*), which is the convention (*samaya*) made by God that such and such a meaning should be understood from such and such a word. All language is therefore conventional but the modern school varies the rigour of the ancient by admitting in the case of proper names the exception that the convention is imposed by human instrumentality while some supporters at least of the older view argued that though the immediate instrument was man yet in giving a proper name the father was obeying the command of scripture to assign a name to his son, and therefore the action was ultimately divine a subtlety which even Viçvanatha rejects. Of more value is the further definition of significance given by Annam Bhatta which makes it that relation between word and object which serves to call the object to memory when the word is spoken. The nature of significance as the power in

¹ TA p 16, TS § 59 SM on BP 81, VSāra pp 29 209-19

words to convey the sense imposed upon them by convention human or divine is not further elucidated in the Nyaya which rejects, however¹ the Mimamsa doctrine of the existence of a special category of power (*śakti*) taking just exception to the multiplication of entities which would result if every capacity of a substance were thus given the rank of a category.

Freed from the burden of a binding tradition the Nyaya was able to deal more effectively with the problem of the precise denotation of words. To the Mimamsa a word denotes the class (*jati*) and the notion of the individual (*vyakti*) arose from necessary implication only, an opinion shared by the schools of grammar and rhetoric². The modern Nyaya for its part adopted the other extreme view: the word denoted the individual concrete object its attributes coming in by implication alone. The Vedanta sought to combine the opposing views by a distinction between the express and latent signification of the word which was deemed primarily to refer to the class concept but only to do so in virtue of its acknowledged connexion with the concrete objects included in the class. The Buddhist view was very different: faithful to the opinion that the true nature of anything cannot be known but merely its differentia they held that the signification of a word was merely expressive of distinction from other things (*vipakṣi*). To the ancient Nyaya³ which Annam Bhatta and Viśvanatha follow the word denotes at once the individual object the class of which it is a member and the distinctive property of the class (*akṛti*).

³ NS II 2 60-8. TC i 1 659 ff. NB, pp 101 ff. NV, p 314 ff.

While the meaning of language is conventional the modes of acquiring it are various. The Vedānta lays stress on the use of gesture—objects are pointed out to the child and the names given. Other sources given by the Nyāya include the usage of life in which the child by hearing the same word used in different contexts gradually comes to learn its sense—grammar which teaches the meaning of roots, terminations, and cases, dictionaries, instruction by experts, comparison, explanation by synonyms, context and contiguity the former applicable in the case of a word of generic meaning whose precise sense is thus indicated, and the latter serving to make clear the meaning of an unknown word by its proximity to others already familiar.

The sense of the words thus acquired is the primary or direct sense as opposed to the secondary or implied signification (*lakṣaṇā*)¹. The primary sense however may bear various relations to the etymology of the term. It may remain true to its root meaning (*yaugika*) as in 'cooker' from 'cook', it may have a customary sense (*rudhī*), as in *ghata* 'pot', which even if it is to be traced as held by one school of Indian grammar to a root still bears no obvious connexion with it, or it may without sacrificing its etymological sense be restricted by custom to one only of the objects to which it might apply (*yoga rudhī*) as in the case of *haṣṭin* 'elephant' where usage has confined the term 'possessing a hand' to one only of the animals which might thus have been styled. More artificial is a fourth class (*yaugika rudhī*) mentioned by Jagadīṣa² and Viṣṇu nātha which includes words whose sense might be explained equally well either as etymological or customary.

¹ TC iv 2 660 ff. cf. *Padārthasamudāhāra* p. 16.

² TA p. 21 cf. TC iv 2 691.

The implied sense falls in the view of the ancient Nyāya into four subdivisions in the first the original sense is merged in the implied meaning as in 'the tribunal applauds', in the second the original sense remains, but something further is suggested, as in 'Guard the ghee from the crows', where the command is understood to apply also to other birds, in the third a part of the primary sense is left out, and a part retained, as in the Vedānta doctrine 'That thou art' where 'that' denotes the unqualified absolute, and 'thou' the qualified soul, which divested of its qualities, is the absolute, fourthly by a process of implication on implication, the term *dvivepha*, 'having two rs', originally applied to the word *bhrumara*, bee is used of the bee itself. This last class is rejected by the modern school,¹ which attributes it to the Vedānta. The modern school differ also from their predecessors in their view of the cause which gives rise to implication, the latter assert that it arises from the inapplicability of the primary sense in the context but the modern school with more justice claim that it depends on the purpose of the speaker for in some cases there is no apparent incompatibility between the literal sense and the context to give rise to implication.

Govardhana² gives a different division of the implied sense into primary (*śuddhā*) and secondary (*grāntī*), the former of which includes the first two of the divisions ordinarily accepted. The secondary form of implication covers such a case as *Guṇḍāyām ghoṣāt* 'the cowherds' station on the Ganges', where the qualities of coolness and holiness which mark the current of the sacred river are attributed to its bank. The doctrine is important,

¹ It is given by Viśvanatha only cf. *NKos* p. 159 Jayalera on T. 1c 2 66a.

² On T. 1c 9

for it is part of the reply of the Nyaya to the doctrine of suggestion (*vyajana*) on which from the eighth century onwards an important school of poetics was founded¹. Suggestion based on words (*śabdi*) was classed by the Nyaya as secondary implication suggestion based on thought was included under inference. Thus when the maiden says

Go if thou wilt beloved, safe be thy journeying,
There may rebirth be mine where thy journey endeth

the intimation that parting will cause her death is attributed by the theory of poetics to suggestion but by the Nyaya is regarded as merely inference. The theory which reduces suggestion to inference has its classical exponent in Mahima Bhūti and formed the subject of an elaborate refutation by Mammata but his arguments failed to persuade the Nyaya school of the untruth of their theory.

Words, however by themselves alone convey no meaning they derive their signification from their serving as members of sentences (*vākyi*) a term which in the Nyaya view applies not merely to propositions containing verbs but to any collocation of words, such as a noun and adjective which has a definite sense. In this view the Nyaya conflicts as often with the *Prabhākara* *Mīmāṃsā*² which finds that words have significance only when constructed with a verb which lends significance to the subject object or other qualification of the action which it expresses. In the Nyaya view no such primacy belongs to the verb or any other part of speech the meaning is conveyed by the collective sense of all

¹ Jacobi ZDMG lvi 396 ff. NGWG 1908 pp 1 ff. *Īśakīyaśloka* (Trivandrum SS 1909) p 2 ff.

² PSPM p. 63. Kunār is allowed of significance in words. Ny p 315, is directed acc to NYT against the *Prabhākara* view of BSM., pp 161 ff.

the words taken together¹ But it is not every collocation of words that can give a meaning there are three requisites which must be fulfilled to secure this result The first is, as viewed from the standpoint of the listener expectancy (*akāṅkṣā*)² the word *ghatam*, accusative of 'jar', by itself is unintelligible it requires its complement in *anaya* bring where the root *a ni* is expressed in the second person imperative, from the point of view of the word it and each element of it demands supplementing by another word or words Secondly there must be compatibility (*yogyatā*)³ between the meanings of the words water burns is syntactically possible but contrary to reality and therefore meaningless In the third place the words must stand in proximity (*samudhi utti*) A word itself consists of a number of sounds each of which exists for three moments only that of its production of its perception and of its passing away so that the perception of a word bears a similarity to the process of recognition the sense is apprehended at the last moment when the final sound is heard and the earlier sounds remain only in memory⁴ In a series of words if there intervenes too long an interval between any of them they cannot be apprehended as a single whole and therefore reasonable proximity is necessary whether the words be spoken or arranged in writing It is not enough however that these conditions should be fulfilled for the meaning of a sentence to be apprehended

¹ TC iv 1 460 ff

² TC iv 1 18 241 TA p 20 TB pp 47 9 TK p 16 17 TS §§ 60 61 BP 84

⁴ TB pp 49 50 NJJ p 101 NY p 314 negates the theory which takes to letters the power of lending them and invents an alternative entity as a substitute whence knowledge of things is derived see SDS, ch xii 18 f 5^o contra SS v 1 7a kara BS 3 28

hended their existence must be recognized by the hearer or reader for if he does not do so he will mis-understand the sense while on the other hand even if they are absent he may by conceiving them to exist read a possible sense into the words.¹

A further condition is however laid down by Gaṅgeśa² Viśvanātha and Jagadīśa and implied in the view of Annam Bhaṭṭa. They require knowledge of the intention of the speaker (*val'ti tatparyā jñāna*) by which means alone for example can one distinguish between the two senses of the words *saṁdhavam ānaya* 'bring my horse' and 'bring salt'. But serious objections are urged against this view on the ground that words which convey a definite sense may yet not be uttered with the purpose of conveying that sense. Thus a fool may utter words which he does not understand or a parrot repeat a sentence without knowing its meaning and it is not a sufficient reply to argue that such sentences are apparent only, not real. A Vedic text must have a definite meaning yet it may be recited by a man who does not understand a word of it it may be wrongly expounded by a teacher or it may be read in a book. In the last case there is no speaker whose intention can be understood in the two former the speaker does not intend to express what is really the meaning. If the orthodox view is adopted which attributes to God the authorship of the text so that the intention to be known is his there is the fatal objection that the meaning of Vedic sentences may perfectly well be understood by those who reject the view that God is their author. A very different definition of intention is therefore given by the *Vedāntaparibhāṣa*³ which makes it consist

¹ TC II 1 236 318 TA &c u s

² TC IV 1 319-74 TA p 90 BP 84 TSD 459

³ p 90

in the fitness of words to express a particular meaning, there being no utterance with the intention to convey a different sense the proviso being intended to cover the case of equivocal terms like *śaundharyam* where the intention of the speaker is to convey one sense only.

Propositions fall into three classes command (*vallī*) prohibition (*nigedha*) and explanation (*arthaśūda*)¹. A command is a sentence which conveys knowledge which forms a base for action as in 'Let him who desires the heaven offer the Jyotistoma sacrifice'. It takes the two forms of a categorical imperative (*nijojī*) applicable to rules which must be obeyed in every case or of a permission (*anyī*) as in the case of rites the performance of which is optional. A prohibition affords knowledge of an act which as injurious is to be avoided while an explanation covers the rest of the field of propositions and includes whatever serves to make clear the meaning of a text. These divisions primarily apply to Vedic texts but are transferred also to profane works.

2. The Authority of Speech

The exact nature of verbal knowledge as a means of proof is a matter of some difficulty and there appears to have been a diversity of opinion between the older and the modern school. Annam Bhaṭṭa defines verbal knowledge as the knowledge of the meaning conveyed by the whole sentence and ascribes as its proximate or special cause the spoken word (*śabḍī*) by which the sense was conveyed. This view is consistent in taking the unit of understanding as the sentence and it is unnecessary to suggest that Annam Bhaṭṭa may have

¹ TK. p. 17. VS ii 1. 63 divides into *edh* (TC iv 21 ff) *arthasūda* (ibid 460 ff.) and *anurūda*. Cf TSD § 81. ISPM pp 110 ff.

² TS § 63. VNT i 1. 3 emphasises that knowledge is of the thing and not of the sentence.

been prepared to accept the theory as applicable to individual words. On the other hand the definition viewed in the light of the proximate cause assigned leaves no room for written works. The defects of this view are avoided in the definition of Viçvanatha¹ who makes the knowledge of words (*śabda jñāni*) not words the proximate cause on which supervenes the comprehension of their signification the final result being verbal knowledge. This view which is that of the modern school is supported by a quaint argument: if the word alone were the proximate cause of verbal knowledge how could a verse written by a dumb man be understood as it is in fact?"

The *Viçaya Sūtra*² establishes the authority of verbal testimony as the assertion of a trustworthy person against the claim that it is inference in a manner which seems largely to give away the case. It admits that as in inference something unseen is inferred from what is seen and as in inference we argue from a sign e.g. smoke to a conclusion e.g. fire so in verbal testimony we draw an inference from a word to a thing signified by it. But the answer is that there is reliance in the matter signified by a word because the word is used by a reliable person (*vyakti*). There is no perception of connexion between a word and its sense such as we find at the basis of inference. There is indeed a connexion but it is conventional as is seen in the actual facts of speech where diverse peoples use diverse words for the same thing. The further objections³ to the authoritative character of the Veda based on its falsehood contradiction and tautology are refuted by arguing that the alleged untruths are due to some defect in the rite

¹ BP 81

² NSāra p. 210 gives gesture and writing as equivalent to speech

³ II, I 49-57

⁴ II, I 58-63

performer, or instrument, through which the hoped for result of sacrifice, e.g. the attainment of a son, is unattained, that the contradictions are merely cases of alternatives permitted, and that the alleged tautology is really useful repetition. The Veda, therefore, is recorded authoritativeness like the spell and medicine because of the authority of their authors, the Sūtra leaving it uncertain whether it ascribed the Veda to God. The *Vaiṣeṣika Sūtra*¹ stands in much the same position. It asserts the conventional character of language, and declares the composition of the Veda to have been due to intelligence. Moreover, it seems to assert that the assignment of names is a proof of the existence of beings distinguished from ordinary men a statement which if it does not point to the recognition of God as the giver of names, does indicate the recognition of seers.² Further doubt is created by the twice³ repeated assertion that scripture is authoritative, because it is proclaimed by God or proclaims the duty of man, as the terms *tadācānat* are variously, and not without a plausible ground in either case explained, the former version having the authority of Pīṣastapāda though it suffers from the disadvantage that God is not directly referred to anywhere in the Sūtra. The claim of verbal testimony to be a separate proof is disposed of by the assertion that it is explained by inference⁴ which gives us either the argument that the conclusion is inferred from the fact that scripture is authoritative as proclaimed by God or from the fact that it is authoritative as proclaiming the sacred law. In any case scripture is freely used by Kanada to confirm his arguments as it is used by Gautama.

The view of the Nyāya is followed by the syncretist

¹ ii 2 14 20 vi 1 1 4

² i 1 5, x 2 2

³ ii 1 16

⁴ ix 2 3

school which in this measure formally departs from the Vaiśeṣika proper, which rejected verbal knowledge as a separate means of proof just as it rejected comparison including both under inference. When words are pronounced they argued¹ and their meaning is recollected there takes place an inference which may be formulated thus: the meanings of the words which are heard are connected with one another, because they are brought to my recollection by the aid of words which are connected by relations of expectation, compatibility and proximity. More simply the argument may be put thus: before a man can utter words he must appreciate the connexion between the ideas which he is about to express in language as is shown by their possessing expectancy &c. and it is not language which establishes this connexion. The reply of the Nyāya-Vaiśeṣika as given by Annam Bhaṭṭa² rests as in the case of comparison on a psychological ground: the consciousness resulting from verbal knowledge as a means of proof is asserted with truth to be different from that obtained from the use of formal inference but this reply does not meet the real point at issue. Udayana³ attempts a more formal answer: taking the syllogistic form of the Vaiśeṣika argument he seeks to demonstrate that the premisses do not warrant a certain conclusion while anything else than a certain conclusion is of no value.

In the Vaiśeṣika view as presented by Praśastapada⁴ it is probable that we must recognize the influence of the Buddhist logic which declined to accept verbal knowledge as a separate source of proof on the ground

¹ TC iv 1 2° ff. PSPM pp. 63-6 rejects human testimony as not in itself valid but only if we believe the speaker to be truthful.

² TSD § 63 cf. NSM pp. 136-44.

school which in this measure formally departs from the Vaiṣeṣika proper which rejected verbal knowledge as a separate means of proof just as it rejected comparison including both under inference. When words are pronounced they argued¹ and their meaning is recollected there takes place an inference which may be formulated thus: the meanings of the words which are heard are connected with one another, because they are brought to my recollection by the aid of words which are connected by relations of expectation, compatibility and proximity. More simply the argument may be put thus: before a man can utter words he must appreciate the connexion between the ideas which he is about to express in language as is shown by their possessing expectancy &c. and it is not language which establishes this connexion. The reply of the Nyaya Vaiṣeṣika as given by Annam Bhaṭṭa rests as in the case of comparison on a psychological ground: the consciousness resulting from verbal knowledge as a means of proof is asserted with truth to be different from that obtained from the use of formal inference but this reply does not meet the real point at issue. Udayana² attempts a more formal answer: taking the syllogistic form of the Vaiṣeṣika argument he seeks to demonstrate that the premisses do not warrant a certain conclusion while anything else than a certain conclusion is of no value.

In the Vaiṣeṣika view as presented by Praśastapada³ it is probable that we must recognize the influence of the Buddhist logic which declined to accept verbal knowledge as a separate source of proof on the ground

¹ TC iv 1 2^o ff. PSPM pp. 63-6 rejects human testimony as not in itself valid but only if we believe the speaker to be truthful.

² TSD § 63 cf. NSM pp. 136-44.

³ K a. iii 13. Cf. NSM commentary p. 202. CD² p. 51. The whole view is refuted KAK. i 330-46.

⁴ i 206 ff. above ch. ii § 2 pp. 106-8.

that it was itself merely an effect of the reality which it represented. Just as when we see smoke we deduce the presence of fire so when we hear a true word we deduce the reality which it stands for every word then is a causal conclusion the thing it represents being the cause and the word the consequence of the cause which is the real fact. The place of verbal knowledge therefore in the view of Dignāga is to be found only in the syllogism as reasoning for another not as an independent means of proof. Praçastapada however departs from the spirit of the Buddhist theory by his acceptance of the authority of the master Kāṇva as decisive and in effect the conception of authority nominally rejected by the Vaiçeṣika thus reappears in full strength. It is easy therefore to understand how the syncretist school accepted the Nyāya¹ view without question since in recognizing the validity of the dicta of Kāṇva Praçastapada in effect rendered the refusal to accept verbal knowledge as a means of proof meaningless. Vyomaçiva² indeed accepted formally verbal testimony as a means of proof.

Not all propositions of course are authoritative that character applies only to Vedic texts and to the utterances of a man worthy of credence and a man's credibility depends in the ultimate issue according to Annam Bhaṭṭa³ on the fact that he speaks the truth or according to Keçava Miçra⁴ that he describes things as they really

¹ Bhāṣarjaya (Nyāsa 1. 29) holds that the validity of verbal testimony is established by experience of its truth in fact (e.g. the result of sacrificial) and the absence of ground for disbelief in one thus competent to declare unseen things which are the main sphere of verbal testimony.

⁴ TB. p. 46. TB. pp. 31-9. *ya k vācānti śaśi ś yadvāntirīkām d* p. 46. The divine authority is dealt with, *ibid* pp. 1-58.

are. In both cases the Nyaya view accepts the utterances as correct on the ground that it believes for reasons which it thinks sufficient that they do reveal the truth of the universe. There is here no question of faith in revelation contrary to the clums of reason. *credo quia incredibile* is not the attitude of any adherent of the Nyaya. What is revealed forms a complete system of coherent truth.

The Veda however is not all of equal authority. It is divided in the later Nyaya into the four classes of *Ṛgveda*, *Itihāsa* and *Purāṇa* in a descending order of value. *Ṛgveda* is the primary fountain of knowledge. *Smṛti* is available only when it does not contradict it or when *Ṛgveda* is silent on the point at issue. The other two sources are of inferior importance. *Ṛgveda* again includes the four Vedas each with its subdivisions of *Saṃhita*, *Brahmaṇa* and *Aranyaka* including *Upaniṣad*. *Smṛti* is represented by the law books and *Itihāsa* and *Purāṇa* by the epic and the Purāṇas. The *Ṛgveda* alone is treated as divine in origin and therefore unconditionally worthy of credence. The other authorities have human authors and therefore are liable to be erroneous.¹

The claim however that the *Ṛgveda* is the work of God is assailed by the *Mīmāṃsā* which urges the view that the Veda is not the work either of man or of God but exists for ever in its own right. How they ask, could God who as incorporeal has no organs of speech utter the words which make it up? If it be urged that he assumed a human form for the purpose of revelation the

¹ Athalye TS p 300 PSPM 1 p 178 ff

² CV pp 30 ff SS 553-5 SDs p 104 Cf the Sankhya v v SS. v 4^o 15 ff where the authorship and eternity of the Veda are denied but its self-proved authority upheld PSPM. p 66 For God's authorship see Kus II and IV

answer is that by such assumption he would lose his power of revelation, being subjected to all the limitations of material existence. Moreover they deny that there is any tradition of either divine or human authorship: the sages mentioned apparently as authors did no more than apprehend the hymns and hand them down in schools. Positively they adduce passages which assert that the Veda is eternal and uncreated. Against them the Nyāya¹ urges that other passages assert the creation of the Veda, but it also adduces more effective arguments. All propositions which we know of have authors, as in the case of those we ourselves enunciate or those of the *Mahābhārata*. To the Mīmāṃsā retort that the argument applies only to works whose authorship is known as in the case of the epic, the Nyāya replies that the authorship of God is assumed for the Veda by the testimony of Gautama in whose school it has been handed down. Moreover if the Vedas were eternal, the sounds in them would coexist from eternity, and it would be impossible to arrange them in the deliberate order which alone permits of their being a means of verbal knowledge. The Vedas, then, must have an author, and their transcendental wisdom forbids our supposing that any man could have excogitated them, leaving us no option but to ascribe them to God.

The Mīmāṃsā, however, has no hesitation in asserting that sound is eternal² it is a quality of the ether and like it eternal, the beating of a drum reveals it to our ears, but does not call it into being, when any letter is

¹ TC iv 1 83 ff., TSD, § 62 with Nilakantha's commentary, NSār, pp. 29, 214-16.

² MS i. 1 6-23, GV, pp. 408-83 (words), 486-552 (Veda) FSPM, pp. 56-61, cf. Çāṅkara, BS i 3 25. Muller's theory (*Six Systems*, pp. 196 ff., 520 ff.) of the word as a creative power is clearly not in the texts.

pronounced in our hearing we recognize it at once with absolute certainty, which would be impossible if its existence were momentary only as the Nyaya believes. The Nyaya rejects the doctrine of the eternity of sound. Gautama¹ gives three reasons for this view, that sound has a beginning, that it is perceived by an organ of sense, and that like any other product it has attributes. If we recognize as we do a sound like *ga* when pronounced by diverse persons at diverse times it is because of the identity of the specific character (*jati*) of the sound which always accompanies it whenever it is uttered or in a homely simile it is like the flame of a lamp which, relit after being extinguished is nevertheless regarded by us as the same as the flame which originally stood in its place.

The Veda then is for the Nyaya a divine revelation of eternal truth but it is supplemented by the statements of men whose knowledge of the truth confers upon them a right to our belief.² Such men are Gautama and Kanada the founders according to tradition of the Nyaya and the Vaiśeṣika systems and it is in the light of this position that the importance of verbal knowledge becomes clearly revealed. The aim of philosophy is not to discover a theory of the universe it has the more modest aim of enabling us to understand as a reasoned system those truths which are revealed for us by scripture or discerned by seers with the superhuman power of direct perception which such men as we have seen command. It is not enough that man should accept tradition alone for his beliefs then would be blind and inaccurate he must study the lines of reasoning laid down in the systems which establish how the truth of

¹ NS II 2 14-59 TC IV 1 3 5 161 Nyāya pp. 29 316 19

² TC IV 1 83 ff.

the revelation can be apprehended. But, if man were to attempt this study without the aid furnished by the declarations of the seers, his chance of success would be negligible: mere ordinary reasoning and perception do not avail in the doctrine of the schools to seize the fundamental truth of the universe.

determination (*ni naya*) the ninth category, of formal discussion (*vada*) the tenth category, and of wrangling (*jalpa*) and cavilling (*utanda*) which are the eleventh and twelfth in the series

With the advance of the philosophical character of the school these dialectical categories became of less and less importance and in the syncretist texts which adopt as a rule the order of topics suggested by the Vaiśeṣika categories they are little noticed. But Keçava Miçra respects the order of the Nyaya, and from him and his commentator Govardhana it is possible to gather some knowledge of the development in conception of these categories which took place between the time of Vatsyayana and the modern school. It is of some interest that while Keçava Miçra tends to accord with Vatsyayana, his commentator follows the views which also find expression in Viçvathas commentary on the Sutra.

This division of opinion is specially marked in the case of the category of principle or dogma (*siddhanta*) which Gautama¹ describes and subdivides into four classes but with such vagueness of expression as to leave full room for the ingenuity of commentators. Its real sense is doubtless that of a tenet considered as part of the system of a school in the later definition of Keçava Miçra it appears as a thing admitted because it is established by one of the means of proof which is wider in extent but not substantially different since the tenets of schools all rest on some form of proof. But it seems, further to have denoted a result in the nature of a corollary from admitted principles and the proceeding by which a principle of the opponent is admitted in order to refute him by showing that some proposition which he sustains is inconsistent with that principle.

¹ 1. 1. 26. 20. 1. 11. NB. and NY. TB. p. 93. 94. SDST. pp. 4. 25. GS&J. 207. 330. TR., pp. 170-4.

Of the four divisions of this category the first is the *sauratantva siddhanta* which Gautama defines as a principle which is not contrary to the views of any school and is accepted in one's own schools. Examples are the existence of the five senses and their objects as given by Vatsyāyana or of sound, even if we doubt its being eternal or non eternal all admit that there is such a thing to adopt Keçava Miçra's instance. The modern school give it a special sense as applicable to a principle which is conceded by two disputants engaged in a discussion for the purpose of that argument. The second class consists of the *pratitantra siddhanta* which is defined by Gautama as that which is accepted by similar schools but rejected by other schools. Vatsyayana illustrates this from principles common to the Sūnkhya and Yoga while Keçava Miçra chooses instead the Nyaya and Vaiçeṣika for his example a difference probably significant of the fact that in Vatsyayana's time the similarity of the schools was not yet so far advanced as later. The modern school¹ with Govardhana take a different and improbable view they mean by it a principle proper to one school and rejected by another as the eternity of sound is asserted by the Mīmāṃsa and denied by the Nyaya and vice versa. The third class *adhiakarana siddhanta* is a principle which follows from the establishment of another principle rather than a hypothetical principle* which if accepted, leads to the acceptance of some other for it is illustrated by the suggestion that if we recognize God as the creator we must recognize as a corollary his omniscience.

On the fourth class the *abhyupagama siddhanta* there is an acute divergence of opinion. According to

¹ So TR., p. 171, who gives the authoritativeness of God as a case.

As taken in SBH viii 9 NBh makes it a principle the establishment of which involves establishing other points.

Keçava Miçra the obscure text of Gautama means that one admits a view of the opponent without examination of its validity in order to follow out its consequences and thus refute another view of the opponent¹ Thus a Mīmāṃsā disputant may admit in arguing with a follower of the Nyāya on the nature of sound that sound is a quality hence he deduces that as sound is in the Nyāya view a quality of the ether which is omnipresent it must be without parts and so cannot grow in size This confutes the Nyāya argument for the non eternity of sound based on the fact that it grows and diminishes in intensity The moderns again with Viçvanātha and Govardhana understand this form of principle to be one which not explicitly stated in the text of a school is implied in it as in the case of mind in the Nyāya view *for while it is not included by Gautama as a sense organ or means of proof but as an object of proof it is interpreted by the school to be included in the class of sense organs* It is just possible to make either sense accord with the words of the definition

The ninth category determination (*nir ayt*) or ascertainment is defined by Gautama² as the ascertainment of a thing after reflection on the arguments for and against it It is clearly nothing more than the definite result of a controversy (*latla*) the different kinds of which are specified in the tenth eleventh and twelfth categories³ The discussion (*i ida*) is a serious debate carried on by those who seek to establish truth by means of thesis (*palśa*) and counter thesis (*pratipalśa*) It must not contravene the principles of the school must whether in demonstration or refutation be based on the

rules of logic, and take place in syllogistic form. There are excluded, therefore, all the means which appertain to sophistry rather than to serious discourse: thus frauds (*chala*), futile objections (*jāti*), and cavilling (*vitandā*), wrangling (*jalpa*) and occasions for reproof (*nigraha-sthāna*) are all out of place. An exception is however, sometimes made of four kinds of occasions for reproof, namely fallacies, which in any case are to be attacked, and the three peculiar forms styled deficiency (*nyūna*), which means omitting a member of the syllogism, redundancy (*adhika*) which means adducing too many members as by adducing more than one reason or example, and deviating from a tenet (*apasiddhānta*). These are clear cases which invalidate argument, and therefore are suitable for challenge. But the discussion must be conducted on the basis of the principles which the controversialist accepts: it is impossible to censure a Buddhist for not using the Nyāya syllogism when his own school recognize two members only in lieu of five.

Quite opposed to the dispassionate argument (*vitaraṅga-katha*) is the passionate contest in which victory alone is the aim and in which frauds, futile objections and occasions for reproof are the stock in trade. Such discussions are divided into two classes the criterion being whether or not there are both thesis and antithesis. In the former case we have wrangling; in the latter mere cavilling.

B METAPHYSICS

CHAPTER VII

ONTOLOGY

1 *The Categories of Kanada and Gautama*

IN the syncretist school it is an accepted doctrine that all things that can be known and named that is all things which exist, fall under seven categories (*padārtha*, object (corresponding to) a name) These are substance (*dravya*) quality (*guṇa*) motion or activity (*karma*), generality (*sāmānya*) particularity (*viśeṣa*)¹ and inherence (*samavaya*) which may be regarded as positive categories, and one category of non existence (*abhāva*) It is, however certain that this does not represent the ancient view of the Vaiśeṣika We have the express statement of Praçastapada that the categories numbered six, and this tradition prevailed long after other evidence shows that the last category had been recognized Madhava² thus expressly states that the number of categories in the system is six as does Hari bhadrā³ though his commentator adds that others recognize non existence. The exact period when the new category was added is unknown It was anterior to Çridhara, for in his exposition of Praçastapada⁴ he insists

¹ Hence the name of the Vaiśeṣika system in Praçastapada.

² SDS, p. 86

³ SDS, 60, GSJ 22 34, 35, so SSS. v 19, 20

⁴ NK, p. 7

that the category of non existence is implied though unexpressed, explaining its omission as due to the relation in what it stands to existence generally and in another work of the same century,¹ Udayana divides the categories into existence (*bhāva*) and non existence (*abhāva*) and then subdivides the former head into the usual six. Thus by this date the recognition of non existence as a separate category parallel in a sense to the six positive categories had come into being, but the full step of reckoning the categories at seven had not yet been definitely accepted. We find this process complete in the work of Ācārya which is styled *Saptaxudārthi* the sevenfold character of the categories thus appearing as definitely established.

It is less certain whether the six categories as such were recognized by Kanada. The text of the Sutra² in one place expressly enumerates the six and though Praçastapada's³ treatment of the topic may be invoked as proof that the Sutra was not in this condition when he used it, this is not sufficient proof in view of the fact that Praçastapada is not a commentator proper. What is much more important is the fact that Kanada⁴ evidently conceived the first three categories to stand apart from the others, he applies to them only the term object (*artha*) and in treating of the contemplation attained by Yoga he deals with the vision thus acquired of the first

¹ *Lakṣanāraṭ* p. 1 Kīr., p. 6 so TR., pp. 180, 163, 164

² 1. 1. 4

³ pp. 6-7 Bodas TS., pp. 90-2 Vātsyāyana's use of the categories (NB 1. 1. 5 and 9) is conclusive for the priority to Praçastapada. The Mīmāṃsā has the same set of four or in Prabhākara's case five to which he added capacity, number and similarity, TR., p. 163, Kīr., p. 26, PSPM., pp. 68-91. Rāṣṭrājñī adds *çakti* and *khyā* *satva* *vaçu* *kyā*.

⁴ vii. 2-3. For the distinction of *asitra* in all six categories, see *śāmbandha* in the first three *sūtras* and in the last three, see FBI translation p. 49 cf. N. 1, pp. 323 ff.

three categories only¹ It is still more important that Kanada specifically declares generality and particularity as relative to the intelligence² which at once gives them a different place from that of the first three categories, while inherence appears only as the relation between cause and effect³ The conception of the categories as a complete division of the real universe is therefore to be ascribed either to Praçastapada or to some predecessor in the school

Gautama's categories as we have seen, are rather divisions of a treatise on logic, and it is the second object of proof (*prameya*) which most nearly corresponds to the categories of Praçastapada. The heads of that category are the soul or self body the senses the objects of sense cognition mind activity error transmigration the effect of good and evil deeds pain and liberation The list is completed by purpose (*prayojana*) which appears as the fourth of his categories The confusion involved in such a division is obvious and explains fully why the syncretist school save Keçava Miçra follow the Vaiçesika in their treatment of categories

2 Substance, Quality and Activity

Substance is a distinct genus but a positive definition can only ascribe to it either the possession of qualities⁴ and action⁵ or being the intimate cause of a product⁶

¹ ix 1 14

² i 2 3, hence the mysterious *buddhalakṣana*s of the last three categories in PBh, cf Kir, p 30

³ vii 2 26, hence it is not very closely parallel to Plato's *εἶδος* α (cf Lutoslawski *Plato's Logic* p 254)

⁵ VS i 1.10 has all three PBh, p 21, uses the criterion of indestructibility by causes or effects cf Kir, pp 32 4 43, 44 VS i 1 12

⁶ TB, p 69, BP 23, TR, p 132

The first suggestion, however, is contrary to the principle that at the moment of its coming into existence a substance has no quality, while the latter expresses a fundamental principle that only substance can give rise to a product. Quality again as defined by Kanada,¹ has substance as its substratum, is without quality, and is not a cause in conjunction and disjunction, a point which differentiates it from activity or motion which is defined as abiding in substance, devoid of quality, and the immediate cause of conjunction and disjunction.² Motion again differs from quality in that the latter resides permanently in substance, the former temporarily. Beyond this definition does not go the Vedānta recognized the impossibility of defining it, and called it inexpressible (*anirūcanīya*), while the Buddhists denied its existence *in toto* a tenet which the Nyāya Vaiśeṣika wholly rejected, as well as the Buddhist doctrine of activity or causal efficiency³ as the one mark of reality.

To the Buddhist argument that all is non eternal the *Nyāya Sūtra*⁴ replies that then non eternity is eternal nor can it be argued that what is non eternal perishes utterly like a fire when its fuel is burnt out. There is a distinct divergence in our perception, what we can see produced and destroyed is non eternal, the rest is eternal and the counter argument that, if the atoms are eternal then their products should be so is opposed to facts of

perception and the conception of time. Nor is it true to contend¹ that there is no substance apart from its qualities, or whole apart from its parts. The substance is marked out by its possession of parts or qualities as one we recognize the jar we saw yesterday which we could not do if there were nothing but sensations of touch and colour. If it is argued that nothing is really existent because it is non-existent as regards any other thing, 'A horse is not a cow', the reply is that each thing has a true existence which necessarily excludes the other. If the same argument² is based on the necessary relativity of all things, the answer is that relations imply terms as much as terms relations.

Elsewhere³ the question of whole and part is defended against the argument of unrecality in connexion with the suggestion that perception is really inference as we see only part of any object and not the whole. If there were no whole it is pointed out there could be no perception, for without a unit everything would be liable to resolution into its ultimate atoms which are not perceptible. Yet another attempt is made to meet this issue⁴. The Buddhist opponent asserts that the whole (*avayavin*) cannot exist since the parts cannot reside in it either as a whole or partially nor can it reside in them nor apart from them nor is it identical with them. The answer given is that the attempt to treat the conception of a whole as a matter of spatial location is mistaken. A whole is something over and above the parts, which stand to it not in a spatial relation but in a unique

¹ *Mādhyama nika I rti*, pp 64, 71. Aryadeva in *M Vrtti* p 71.

³ i 1 30 G, NB, pp 80-6. NV pp 213-52, insist on the argument that a whole is necessary to explain our conceptions of magnitude, conjunction motion, and class. A curious argument as to weight as a criterion of a whole is found NV, pp 237 ff.

⁴ iv 2 4 14. Cf QV, pp 323 47, SS i 42. PSPM pp 90 8.

relation of inherence. The question stands of course in immediate relation to the kindred one of cause and effect, the Buddhists¹ deny that an effect before its production can be described as existent non-existent or both, the Nyāya² contends that a whole which is an effect is non-existent before its production from its causes, thus keeping in harmony with their doctrine that a whole is something entirely other than the parts from which it is made up.

There are nine substances the four atomic earth water fire and air, ether, time and space, the self or soul and mind. The existence of yet another is postulated by the Mīmāṃsā of Kumārila³ to explain darkness whose claim to be a substance rests on its possession of blue colour and motion. These attributes are denied by Annam Bhaṭṭa⁴ who declares darkness to be no more than the absence of large illuminating light in general a view akin to that of Prabhākara who held that it was the absence of knowledge of light while Āṇḍhara⁵ suggests that it is the imposition on something else of blue colour. Darkness, therefore is classed with non-existence pure and simple as it is illegitimate to attempt to set up special categories of non-existence corresponding to each form of being.

The qualities enumerated by Kaṇada⁶ are seventeen colour, taste, smell, and touch, numbers, dimensions, individuality, conjunction and disjunction, priority and posteriority, cognitions, pleasure and pain, desire and aversion and volitions. The list has obvious imperfec-

* i 1 6

tions and the commentators from Praçastapada¹ downwards are unanimous in interpreting the word 'and' used in connexion with the last member as implying others. The orthodox list is made up to twenty four by adding gravity fluidity and viscosity, merit and demerit sound and faculty the last vague term being extended to cover velocity elasticity, and mental impression. But some reduce the number by three omitting priority and posteriority as depending directly on time and space and individuality as the special form of non-existence styled mutual non-existence (*anyonyabhlava*). Others however, increase the number by three or four adding lightness softness or hardness and laziness but these are rejected by Annam Bhatta² on the ground that lightness and laziness are the mere negatives of gravity and volition while the other two depend on the degree of conjunction or disjunction.

Of these qualities³ five belong to all substances—number dimension individuality conjunction and disjunction and may therefore rank as general⁴ qualities. Time and space have no others the ether has sound also. The four atomic substances have the five general qualities and priority and posteriority air has also tangibility or rather temperature and velocity fire has temperature colour fluidity and velocity water has the qualities of fire with the addition of taste gravity and viscosity earth has the same qualities as water less viscosity and smell. Mind which is regarded as corporeal (*murtā*) has the seven qualities of the atomic substances.

¹ p. 10

² TSD § 4 cf. for others NK pp. 10 ff.

³ BP 20-34 elasticity also belongs to all tangible things.

⁴ In the school terminology (PBh p. 96) this class includes priority posteriority gravity artificial fluidity and velocity. But only the five belong to all substances. Comparison with primary qualities is misleading. All are real. NK pp. 59-96.

and velocity. The self has the five general qualities, and nine of its own, cognition, pleasure and pain, desire and aversion, volition, merit and demerit and mental impression, while God has the five general qualities and cognition, desire and volition alone. While the qualities generally are attributes of one substratum only, conjunction and disjunction, number beginning with two and individuality, in so far as resulting from reciprocal exclusion between two or more things, must have a multiple substrate.¹

More important for the distinction of substance than any of these divisions is that between all pervading² (*gatatīa*) substances which have extreme magnitude (*paramamahatpamanūyatīa*) and those which are corporeal (*mūṛta*) and have limited magnitude (*paricchinna-parimāṇavatīa*) or as is equivalent motion since that implies the movement of the parts or whole from place to place which is possible only if the substance is limited in space. Corporeal substances include the four atomic substances and their products together with mind. The other substances are unlimited, and enter into conjunction with all corporeal objects, they are the self, time and space and the ether. The last and the four atomic substances constitute the elemental substances (*bhūta-draṇya*) which singly or by combination among themselves become the material causes of all the products in the universe. Again substances are divided as eternal and transient: the atoms, the ether, time and space, the self and mind are eternal, the products of aggregation are transient.

The special qualities fall to be considered together

¹ Ith p. 9, BP 86-8

² TSD, § 14. Nāṇḍa pp. 705-706, PBh, p. 23, Kir, pp. 34, 35, cf. Raghunātha, PTN pp. 20-7, who claims that *bhūta* and *mūṛta* are true classes.

with the subjects to which they appertain, but the general qualities belong to all substances alike and though they are real they are not necessarily so in the same way as the special qualities. This is most clearly seen in the case of number¹ which is defined as the cause precisely the proximate instrumental cause, of the use of the terms one, two three &c. Of numbers unity is eternal and resides in the individual atoms and the other substances which are eternal plurality exists only in products which are transient. But the Nyaya view is that duality &c are real like unity and are only revealed by cognition the Vaiśeṣika insists that all numbers above one are the creation of a relating cognition (*cipekṣa buddhi*) and not merely made known by it. The process is thus described first there is contact of the sense organ with each of two jars then the knowledge of the genus unity then cognition operates relating the objects each recognized as This is one then duality is created thence the knowledge of the genus of duality, thence the recognition of duality as a quality in the two things, and finally there is left only the impression of plurality for as the relating cognition is a form of consciousness it can endure for no more than three moments as soon as it has produced the knowledge of the quality two in the objects it disappears and with it as cause must go its effect. Other numbers are arrived at in the same way for though some recognize indefinite multitude (*bahutva*) as distinct from definite numbers this view is generally rejected. But though

¹ First in PBh pp 111 13 SP §§ 26 57 TB pp. 79 80 TK p 5 TS § 94 BP 106 9 VSU iv 1 11 Kanada's doctrine of unity is given VS. vii 2. 1 2 8. Cf TR. p 152 ibid p. 164 Prabhākara's doctrine of a special category number is refuted Cf Cowell SDS pp 101 ff Raghunātha (p 75) accepts it cf Padārthanirṇāya pp 29 30

the Vaiśeṣika thus accepts all numbers over one as a product of mental activity, it does not extend this view to unity itself

On dimension (*parimāṇa*)¹ the school has little to say. It is the proximate instrumental cause of the use of measurement, and may be divided into four kinds: minuteness (*anūṭva*), largeness (*mahatva*), length (*dirghatva*) and shortness (*hrasvatva*) but this rough division between magnitudes or two or three dimensions and those of one only is often dropped and as in the Sāṃkhya only the first two are recognized. Each class again may be subdivided as medium and extreme: the ether has extreme greatness, a product like a pot, medium greatness, an atom, extreme minuteness, a binary medium minuteness. Dimension is eternal in eternal substances, transient in others; in the latter the dimension is determined by the number, magnitude and arrangement or aggregation of parts² but in the former, as an essential part of the atomic theory by number alone. But of the precise character of extension there is no investigation though it is deemed to be absolutely real and not dependent on cognition.

Individuality (*prthaktva*)³ is the proximate instrumental cause of the practice of separating one thing from another. As against the conception of reciprocal non-existence (*anyonyabhlava*) with which some seek to identify it, it is real, not notional, in character. 'The pot is not a piece of cloth' is essentially different from 'The pot is separate from the cloth' which makes it

¹ PBh, pp. 130-2. SP §§ 27-83. TB, pp. 80-81. TK, p. 5. TSD § 25. BP 103-13. TR, p. 144. SS, v. 10.

² VS, vi. 1-8-9 with commentary.

³ PBh, p. 133. SP §§ 28-89. TB, p. 81. TK, p. 5; TSD § 26. BP 113-114. Cf VS vii. 2-2-8. TR, pp. 144-150. It is denied the rank of a quality, as are priority and posteriority by Raghunātha. ITV, pp. 28-30.

clear that the two things are positively distinguished. Again, we can say that a pot is not the quality of colour which resides in it, but not that the pot is separate from the colour. Individuality may be eternal or transient according as the substance in which it resides and by an adaptation of the theory of number a distinction obviously of no value is made between the individuality of a single thing and that of two or more objects which is produced by the operation of a relating cognition. But individuality itself is not due to cognition but absolutely real and its relation to number is not examined save in the unfortunate hypothesis of two kinds of individuality.

Conjunction and disjunction (*samyoga* and *vilhagī*)¹ also appear as real being caused by motion. They are the proximate instrumental causes of our use of the expressions united and separate and are artificial and transient as they apply only to the contact of things which have been apart and the separation of things which have been united. Contact is primarily and properly due to motion (*karmaja*) whether unilateral as of a bird to a tree or bilateral as of two butting rams. Secondly it is due to another conjunction thus the body is united with the tree through the conjunction of the hand and the tree and an effect on its production thus becomes united with something already connected with its cause. Direct conjunction may be produced by a violent motion like sound or by a gentle motion. Every kind of conjunction affects a part of the thing only and may be destroyed by separation or by the destruction of the things connected. Disjunction for its

¹ VS vi 2 9 11 with commentary PBh pp 132-41 151 4

TS §§ 27 28 BP 11a 20 TR p 144 PSPM p 33 Padārthara
śamādhā pp 32 33

part is distinct from the act of separation which is due to motion, and denotes the state of separation existing between two things formerly in contact. It is subdivided as is conjunction but the Vaiṣeṣika alone accepts the doctrine of disjunction by disjunction as in the case of the disjunction of the body from the tree by disjunction of the hand. This denial that the motion of part is the motion of the whole is repudiated by the Nyāya school.

The part played by the category motion¹ in the process of conjunction and disjunction is simple: it is the cause by means of separation of the conjunction of an object with another point of space after there has taken place the breaking up of its conjunction with an anterior point of space. Motion thus takes place in five stages: an object is in contact with a definite point of space, by the effect of motion it separates itself thence, thus there arises the destruction of its connexion with its first position in space, then there is conjunction with a new point of space, then the motion ceases. Motion may be vertical, throwing up or down horizontal expansion and contraction, or of any other kind summed up in the generic term 'going'. The term used for it which signifies properly activity (*karman* *kriyā*) is significant: it suggests that it originally² had a wider conception in which it applied both to volition and motion as the two great aspects of activity and has come to be restricted to the latter by the designation of volition as a quality of the self. Motion as defined is in all its varieties transient and is destroyed either by a subsequent conjunction or the destruction of its substrate, substance.

¹ TS: 1.7, 14-17; 11.1-23, PBh pp. 290ff. T1, p. 14. TB, p. 86. TK, pp. 1, 20, TS, §§ 5, 76, BP 6-7. TR, p. 156. PSPM, p. 31, *Padārtharatnamālā*, pp. 40-2.

² So Kumārila *CV*, p. 335. There is no trace of recognition of chemical action in *śāṇḍī*: he recognizes *φωσ* only, not *ἀλλοιωσις*.

Unlike the other general qualities priority and posteriority¹ are restricted to the four atomic substances and to mind and in the latter which is eternal they are spatial only. They are the proximate instrumental causes of our conceptions of near and far in space and time alike. As such obviously their attributions as qualities to objects cannot be regarded as in any way ultimate as we have seen this recognized by some members of the school who remove them from the list of qualities. An important admission as to their dependence on thought is made by Praçastapāda when he recognizes that the judgement by which one object is assigned a position in time or space relative to each other is due to the operation of the relating power of cognition (*apeksabuddhi*)²

While the ultimate atoms, air the ether time and space the self and the mind are inferable only in the Vaiçeṣika view though the Nyāya permits the direct perception by the mind of the self the qualities are for the most part the objects of perception if present in objects possessing magnitude. Thus the five qualities of temperature or touch, colour, smell and savour and sound are perceived by one sense organ only³ that appropriate in each case the five general qualities together with the illegitimate qualities of priority and posteriority and with fluidity and viscosity are apprehended by the two senses of sight and touch, cognition, pleasure and

cognition¹ it seems to follow that he conceived that if a property resides in many things and if we use that property as means of grouping these things it becomes a general property (*vāmānya*) and that if it is regarded as distinguishing these objects from other objects it is a particularity (*viśeṣa*). But on this substructure Pīṣṭapada² and the whole school have built a rigid realism which regards generality as eternal, one, and residing in many things but only in the categories of substance quality, and motion. As eternal it is distinct from such things as conjunction and duality which though residing in many are transient, as one it differs from the dimension of an atom, and it resides in many by inherence (*samarūpa*) thus differing from absolute non existence, which is not so connected with things. Generality may be divided according to its degree into the major and the minor³ the former of which consists of existence alone, which is found in the three categories of substance quality and motion while these categories themselves are minor generalities. But from another point of view a threefold⁴ division may be preferred that of most extensive (*vyāpaka*) which includes essence that of intermediate (*vyāpya vyāpaka*) which includes the three categories, and that of narrowest (*vyūha*) which covers such generalities as the genus pot where the term genus is to be understood as referring to the common characteristic and not to the individuals comprised under it. The latter division accentuates the fact

¹ i 2, 3 ff. Badly explained away in Kir p 30 and in NK as meaning that their existence is proved by intellect.

that the general characteristic is deemed to be something which actually exists and in harmony with this view it is made the object of perception either by means of all the senses in each appropriate case, or of mind alone in the latter case falling under the concept of extraordinary or supernormal perception¹. The reality of generality lies also at the basis of all predication.

Generality as true is immediately connected with its substance quality or motion and in this aspect can be styled a true class concept (*jati*). On the other hand there are common characteristics whose connexion with a number of things is only mediate and which therefore rank only as mere generality (*upadhī*). The causes which prevent a common characteristic or mere generality becoming a true generality or class concept are given by Udayana² as six. If there is but one object such as ether there can be no class. If the same object has different names such as pot and pitcher there are not two separate classes. If there is cross division a class concept is excluded thus the four atomic substances and ether constitute the products (*bhūta dravya*) the same four with mind the corporeal things (*mūṛta dravya*) and thus neither can be a true class. Nor can there be a class of a class on pain of a regressus ad infinitum. Again the notion of particularity absolutely refuses to allow of forming a class of it. Finally, as every class concept resides by inherence in its objects

¹ Cf. Plato, *Soph.* 254c 255a, for the category of *οὐκ ἄστροφος* : *καὶ τὸ αὐτὸν θατέρων*. Plot. nos. v 13. Generality is not dependent on the individuals but does not exist apart from them: it is at once *ἐν πᾶσι πολλοῖς* and *ἐν κατὰ πολλῶν*. Cf. above ch. i §1 3. Aristotle *E i 6*. Raghunāṭha (PTV pp. 49-51) denies a genus to existence (*sattā*) and quality as a whole (*gṛahya*).

there cannot be a class of inherence for else we would have the absurdity of inherence as a class residing by inherence in inherence. The distinction therefore is clearly that between real natural classes corresponding to facts in nature and classifications based on our thought only and it is by no means unlikely that it was this distinction which made the younger school persist in or even invent the conception of generality as absolutely real. Such a conception afforded an answer to the apparent difficulty why we should frame such obviously conflicting ideas as those expressed in knowledge of true and arbitrary or shifting classes and induced the school to adhere to their realism¹ despite the strong attacks directed against it by Buddhists and Jains alike.²

To particularity Kanāda refers only in its connexion with generality as dependent on cognition³ while he elsewhere distinguishes it from the ultimate particularities residing in the ultimate atoms of matter.⁴ On this Praśastapada⁵ and the rest of the school of the Vaiśeṣikas found their theory of particularity as an independent reality residing in eternal substances that is the atoms and the other five substances and distinguishing them from one another. The necessity for such a distinction is established thus. We can distinguish between any ordinary objects by enumerating their constituent parts the empiric individual being that which has a bodily form and special qualities,⁶ but when in the

ultimate analysis we reach simple substances like the atoms or selves we can find no parts to permit of distinction yet as we are assured of distinction we must assume that there lies in each individual a quality *sva genus* which makes it distinct from all others and serves this function alone. To this view the objection was taken before Praçastapada, and is adopted by the modern school of Nyaya that there must be something to differentiate the particularities and the reply is made that this is a function which they perform for themselves as well as differentiating the substances in which they inhere. It is hardly surprising that this expedient should have proved unconvincing and that the retort should be made that there is no good ground for not attributing to the atoms themselves the inherent power of self discrimination instead of multiplying entities. Nor has the doctrine any acceptance¹ in other schools being rejected by both the Prabhākara and Bhatta schools of Mīmāṃsā the Vedānta Buddhism &c. In any case it is admitted that particularity cannot be the object of perception but can only be inferred.

Of inherence Kanada² tells us only that it is that through which it is said of cause and effect that the one abides in the other (literally 'that this is here') but the principle is already developed in Praçastapada³ to the definition that it is a connexion which exists between things which cannot exist separately and stand in the

¹ Species of course is accepted but not particularity cf. TR. p. 163 PSPM. p. 90. The schools use *reçastapada* *serim* *nately* in both senses. Ragī anātha (PTN. pp. 30-32) denies particularity, cf. *Pad. rtiar tna* 3. vi pp. 44-8.

relation of substrate and that which exists in it, and which produces the concept expressed in the word 'Here'. There is no substantial difference in the modern definition of inherence as one and consisting in an eternal relation between things which cannot exist separately (*ayuta suddha*). The description as one and eternal is intended to refute the objections of the Prabhakaras and the modern Nyaya which reject both appellations. The unity of inherence is proved like the unity of existence by the fact that there is no difference in principle between the different cases in which we infer the relation of inherence. The eternity is proved by the simple argument that, since every cause is linked to the effect by inherence, assuming that inherence were an effect it would be based on itself, which would lead to a *regressus ad infinitum*, and therefore be absurd. But the eternity is relative, not absolute, like that of the atoms, it denotes only that the relation can only disappear with the disappearance of the things related. Such a relation differs entirely from conjunction which can only exist between things normally separate, and it is confined to the five cases of the relation between the product and its parts both of which must be substances, substance and quality, substance and motion, generality and the individual and particularity and the eternal substances in which it resides. From the fact that it exists between things which are imperceptible such as sound and ether as well as between objects of sense the Vaiśeṣika¹ deduces that inherence is an object of inference only, but the Nyaya insists that it can be perceived by a special process of perception.

The difficulties of the doctrine have not failed to awake lively criticism, especially as the view of inherence

¹ PBh, pp. 3-8, 323, Nkoṣa, p. 881, VSU vii 2 25

stands in indissoluble connexion with the doctrine of causation. The Bhaṭṭa Mīmāṃsā Vedānta Sāṃkhya and Buddhist alike decline to accept it, and Ćāṅkara in particular destroys the conception in his exposition of the *Velinta Sūtra*¹. He points out the impossibility of the argument which seeks to distinguish conjunction and inherence, the former is eternal as well as the latter, for instance, in the case of the relation between ether and the ultimate atoms, it is useless to assert that inherence can exist without a third thing to unite it with the things in which it exists while conjunction needs inherence to hold it to the things which are in conjunction and the difficulty is not removed by the verbal expedient of calling one a category and one a quality. Moreover, the argument that there must be this relation between cause and effect cannot be accepted. If cause and effect are inseparably connected as the Vaiśeṣika holds then is it not far more simple to assume that there is identity of essence between the two? Moreover the conception of inseparable connexion contradicts point blank the idea that cause precedes effect which is an essential part of the Nyaya Vaiśeṣika doctrine of causality.

4 Cause and Effect

The Nyaya Vaiśeṣika doctrine of cause and effect stands in immediate relation to that of inherence which as appears from Kanada was first conceived as the relation between these two. But the development of the examination of cause did not adhere strictly to this

¹ 11 2 13 17 Cf. Aroka *Avayav urakarana* SBNT* pp. 8 86

pp 59 100 who regards it as many and both eternal and noneternal
perceptible and imperceptible

dictum the concept includes much beside the cause, which in the strict sense of the word is the inherent cause, though that always occupies an essential place in the theory

In the final form¹ of the doctrine the cause is that which always precedes the effect is necessary to it, and that not merely as an accessory cause (*anyathā sādhanā*). The precise nature of accessory causes is not, however, very explicitly stated, they include matters which, though in relation of inherence with the cause proper, are not themselves directly instrumental in causation like the colour of the threads in the production of a rug, those events prior to the cause which only remotely affect it, such as the father of the potter in relation to the pot, and generally all influences which, though in relation with the cause, are neither necessary nor sufficient to produce it, such as the ass who carries the clay for the fabrication of the pot. Viṣṇumatha subdivides the first two classes into two each, but the last class clearly covers the whole field, and its vagueness is obvious

Causes are divided into three kinds - The first is the inherent cause, in which case the relationship is that of inseparable connexion. It is illustrated by the relation of the threads to the rug, as opposed to the shuttle which aids in the production of the fabric, and the same relation exists between all products and the substances of which they are made. It holds also between sub-

¹ TA, p 4, TB, p 11, TK, p 7, TSD, § 38. BP 16, 13 22, cf KKK n 158 73. Raghunatha (PTN, pp 71-4) claims for causation the rank of a category

² The whole doctrine is implied in VS x 2 1-7, 1 1 18 n 1 2, where the causal character of the substances, qualities, and motion is given, PBh, pp 21, 24, 98 102. SP, §§ 62, 179, TA, p 4, TB, pp 15 25, TK, p 6, TSD, § 40, BP 17, 18, TR, 1 p 152 4, 156, 157

stance and quality and substance and motion the rug is the inherent cause (*samavajjāraṇa*) of its colour and it is readily admitted that as the cause must precede the effect at the moment of its coming into being the rug must have no colour and since it can also have no dimension cannot be perceptible at all until these attributes have come after an infinitesimal delay into being. Secondly there is the non inherent cause (*asamavajjāraṇa*) which inheres in the same substratum with the effect or with the inherent cause. The first is the relation of the arrangement of the threads of a rug to the rug the arrangement or conjunction as a quality is inherent in the threads which are the inherent cause of the rug. The relation may secondly be indirect thus the colour of the threads of the rug stand in this relation to the colour of the rug the colour of the threads inheres in them they inhere in the rug and the colour of the rug inheres in it. Thirdly the category of instrumental cause (*nimitta kāraṇa*) is the receptacle for every sort of cause which cannot be brought under the two preceding heads including the agent in it again there may be drawn a distinction between special and general causes of which there are eight. God his knowledge desire and action antecedent non-existence space and time merit and demerit to which some add absence of counteracting influence¹. But in this view of the third category it seems that the term cause is too widely applied and includes what is not necessary and a better method is that followed by those who distinguish between primary (*mukhya*) and subordinate causes and

¹ Cf. Atthalye TS pp. 207-208. The idea is applied to the case of perception in NS i 1-2 as regards duration space time and either as regards space and time see PBh p. 95 Kir pp. 38-39 VS v 1. 10 v 2. 10. 16. Faddegon Yaç. Syst. m. p. 19.

that of Annam Bhatta¹ who makes it the positive correlate of an anterior negation thus emphasizing the fundamental feature of the doctrine of causality in the Nyaya Vaiśeṣika its denial that the effect always exists prefigured in the cause (*a sat karyā tad i*) The doctrine is already expressly insisted upon by Kanada² without a cause there can be no effect not however without an effect no cause Thus the doctrine of the school is that the cause always precedes the effect and the latter has no existence until it is brought into being It has therefore some affinity with the Buddhist doctrine of the generation of being out of not being and it stands in absolute contradiction with the Sāṃkhya³ assertion of the pre-existence of the effect in the cause (*sat kārjā tad i*) or the Vedānta⁴ view which preserved the identity of the cause while holding that the effect was ultimately illusory The Sāṃkhya lays stress on such arguments as the fact that in experience we see that there can be no creation of anything new the blue colour can never be converted into red the sesamum can be traced in the oil pressed from it, no effect is ever produced from any cause as would be possible on the Nyaya view but only from a specific cause if the suggestion is made that the cause possesses some power to produce the effect is this power connected with the effect? If so that is as much as to say the effect is prefigured in the cause if not there is the fatal difficulty as to the concurrence of definite effects with definite causes Finally as cause and effect are correlative ideas it is impossible to assert the existence of cause without its producing at once the effect The Nyaya reply is not uningenuous the same

¹ TS 4 99

atoms make a pot or a saucer, on the identity theory the atoms pot, and saucer should all be the same which is not the case, an argument which the Vedānta meets by denying that things which are equal to the same thing are equal to one another. The shape of a pot again is not to be traced in its constituents and must be new. Or if it is argued that the effect is latent but is made manifest then the manifestation itself being an effect, must have existed previously and so on indefinitely. This argument can only be met by resort to the Vedānta theory that the whole manifested work is but the play of illusion and that one real alone remains. Hence Ćankara's onslaught on the conception of inherence in its relation to causality escapes the difficulty of the Sāṃkhya, which is compelled to ignore obvious facts by its insistence on the prefiguration of the real cause in a real effect. But it is difficult to hail Ćankara as the predecessor of Kant¹ in his treatment of cause, when it is remembered that it is not this category merely but everything in the universe which is projected by the cosmic power of illusion.

Apart, however, from the fundamental problem of causation, there are obvious weaknesses in the doctrine of the Njaya Vaiṣeṣika. The ignoring of the agent is obvious and inexplicable for on their own view the agency of God is an important feature in creation and their doctrine of causality and non-existence adapts itself admirably to permit of the proof of the creative power of God. The distinction between inherent and non-inherent causes is untenable and inaccurate as the latter are in indirect relations of inherence while non-inherent applies properly to instrumental causes. Nor is there any recognition of the conjunction of inherent

¹ *Athalya, TD, I* 205, *contra, Deussen, allgem. Gesch., I* iii. 625.

causes to produce a result despite the obvious problem presented in the familiar case of the pot in view of the presence of water in its materials¹ and the argument against the Sāṃkhya theory which can be deduced thence is palpable. Needless to say, the more complex case of chemical compounds is ignored² as are also the plain facts of the same effect produced by apparently different causes or the intermixture of effects. In no case does there more clearly appear the divorce of the system from practical scientific experience.

5 *Non existence*

In Kanada non existence, as we have seen does not appear as a category. His own doctrine misinterpreted by his commentators, amounts to this³. Absolute non existence or negation is not a predicable at all, antecedent non existence, the condition of the cause *qua* effect before it produces its result subsequent non existence, the condition of the effect when resolved into its elements, and mutual non existence the relation between things possessing identity of their own all have definite relations to reality and do not form a special category. In the Nyāya⁴ we find the germ of the idea of not being as something knowable and existent in the

¹ VS i 1 23 applies only to union of similar substances. combination of motions is denied i 1 24 and causation of motion by motion i 1 11.

² There is no trace of a recognition of chemical compounds or an organic whole as suggested by Chatterji *Hindī Realism* pp. 27, 56 whose authorities (NVT, p. 280, K r, pp. 114-115) do not bear out his contention in any way. The refusal (VS iv 2 1-4) to allow of a combination of heterogeneous atoms to form the body shows the real view of the schools. Contrast Seal *Positive Sciences*, pp. 98-121.

³ ix 1 1 ff.

⁴ VS ii 2 12 with NBh and NV. NBh p. 2. NV pp. 10-33. NVT, p. 23, above, chap. ii § 2.

same way as being the knowledge being based in the Bhasya on inference but later ascribed to direct perception in a peculiar form. Two forms of negation are recognized in the Sutra explained in the Bhasya as non-existence prior to being brought into being and non-existence after the destruction of the form of the thing brought into existence. Harmony between the Vaiśeṣika and Nyaya was established before Jayanta and Vacaspati¹ the latter of whom gives the classical division of negation as based on identity or correlation the latter comprising the three varieties of antecedent consequent and absolute non-existence². The older Nyaya tradition however retained the Sutra standpoint by explaining that absolute non-existence was merely antecedent non-existence without a determining limit and negation of identity was similarly antecedent negation conceived of as in relation to a different thing which it never becomes. Antecedent negation explains also negation of requirement and of capacity not previously existing while subsequent negation disposes of negation of prior capacity if these further divisions of negation are adopted.

The syncretist school while adopting non-existence as a separate category always recognize its correlation to being, negation is knowledge dependent on knowledge of the positive counterpart (*pratiyogin*)³ an idea familiar in rhetoric where in 'Thy face is like the moon' the latter is the counterpart of the relationship of similarity abiding in the face. The pot is the counterpart of its

antecedent or subsequent non existence, it is an effect of the one and a cause of the other, in absolute negation the counterpart is determined by a relation of negation with its substrate e.g. the ground on which the pot once seen is no longer present. From absolute negation mutual negation differs by resting on denial of identity *not of relation*. Beyond these four classes some Vaiṣeṣikas¹ went by distinguishing from absolute negation temporary negation (*samayī abhāva*) as in the proposition 'The pot is not on the ground' while Annam Bhatta refutes this subdivision with the argument that the non existence of the pot on the ground is permanent and only temporarily obscured by being covered up with the pot when it is present. Yet another teacher Śrīdanda introduced the conception of the non existence on the ground of a pot because there is there instead a cloth but this futility did not win much support.

Needless to say this conception of non existence as a reality received no support from the other schools and the Mīmāṃsā in particular was ready to show that the position of the Nyāya Vaiṣeṣika involved them in a fatal *regressus ad infinitum* inasmuch as if non existence were a reality then the negation of non existence must be another reality and so on indefinitely. To meet this objection the weight of which was of course decisive for the school the ancient Nyāya developed the view that the negation of a negation was equivalent to the positive. The modern school however repudiate this view a negation cannot they hold ever be equivalent to a positive but they admit that the negation of the negation of the first negation is equivalent to the first negation².

It is more interesting to note the sympathy which exists between the doctrine of the school and the Buddhist view of the momentariness of existence, which finds expression in the doctrine of causation also. Cognition in the Buddhist doctrine of momentariness developed in the Sautrāntika school¹ persists for a moment only: it is non-existent, existent, and gone, and in harmony with this we have the antecedent non-existence, existence, and subsequent non-existence of cognitions in the Nyāya Vaiśeṣika, where, however, with characteristic adaptation to meet the view of the school² the length of existence of the cognition is conceived in three aspects, that of its coming into being, that of its disappearance, and the intervening space. Sound also is subjected to the same treatment possibly already in Kanāda, and certainly in the work of Praçastapāda.³

³ p 25; Kīr, p 38 Cf for cognition, AS iii 2 1 ff To say that cognitions endure for three moments (Athalye, TS, p 167 *Sūtri*, *Intr*, p. 215, *upatti*, *śhūti*, *vyaya*) is the doctrine of the later texts, e g. TE, p 19, TB, pp 83, 84, but it is a mere matter of terminology as the doctrine is in effect in PBh, p 287 But the exact form of the doctrine is not proved for either Sūtra On the *kṛāna* cf PTN, pp 58-61, *Padārthasamūhā*, p 85 Contrast the view of duration as real, James, *Psych.* i 409 ff Pringle Pattison *The Idea of God*, pp 350 ff

CHAPTER VIII

THE PHILOSOPHY OF NATURE

1 *The Atomic Theory*

THE doctrine of the existence of real things in the universe had to face when it was first expounded in definitive form the presence of the powerful influence of the doctrine of vacuity (*cūnya vāda*) or philosophic nihilism of the *Madhyamika* school of Buddhism which owes its establishment to Nagārjuna.¹ The essential principle of this school, whose views may be compared usefully with the dialectic of Zeno, asserted that on analysis our ideas present such inconsistencies and incompatibilities that there can be nothing real underlying them, they deny therefore not only the true existence of external reality, but they do not admit that thought itself is real, so incoherent and contradictory is it. Thus against the claim of realism that there is both truth and reality, it is argued that on investigation the true essence of things is not revealed we form the notion of a cloth, but when we examine it we find only a mass of threads, whence it follows that our notion was an error. Again it is urged, just as the objects seen in a dream, magic, *fata Morgana*, and mirage, are not real though we believe in them, so also neither is our knowledge nor its object real.² The response of the *Nyāya*

¹ *Madhyamaka Sūtra*, I ff., iv 3, xiii 2, 3 cf. SDs, p^c 11 SSS 111
I, above, ch. II, § 2

² *Mādhy. S.* vii 34, *Vitt.*, pp. 178, 445 cf. Gaudapāda, II 5 ff

*Sūtra*¹ as expounded by Vātsyāyana is effective. If there is proof it is urged that nothing exists then this proof sublates its own existence. If there is no proof how can it be established that nothing exists? If it is to be assumed without proof then the opposite contention is at least as legitimate. The fact of our ability to analyse our notions confutes the belief in their unreality and that of their objects. It cannot be expected that we should have a separate perception of the whole and its parts or of the cause and its effect. As regards the argument from the dream state it is pointed out that no argument is adduced by the nihilists to show that the knowledge we have is really comparable to that of a dream in place of that of our waking experience nor again is it shown that our dream experience is of non-existing things. To these retorts Vātsyāyana adds the telling argument that the only ground on which it can be taken that things seen in a dream do not really exist is that they are seen no more in the waking state which implies that our waking experience is real.

Probably at a time after the production of Vātsyāyana's *Bhāṣya* the need was felt in the school to combat the further development of the nihilism of Nāgārjuna which in the hands of Asaṅga² and Vasubandhu led to the doctrine of idealism (*vijñānā vāda*) which denied absolutely the reality of external things and accepted as the only reality our ideas or mental acts including perception. In their view therefore external things were merely products in our consciousness due to ideas

¹ v. 26-37 Cf. Čankara on BS i. 2. 18-6 Kumārila ČV pp. 148-80 PSPM pp. 94-95 83 SS 1.48 ff

² *Mahāvākyā-trāṭaka* i. 18 x 53 ff cf SDS p. 10 SSS i. 2 Stcherbatsky's *Museon*, vi. 144 ff Gaudapāda's attitude to the *Vaṇṣika* shows both Mādhyamika and Vjñānavāda off once see JRAS 1910 pp. 129-40 JAOS xxxi. col. 4.

existing independently of objects a modified form of which doctrine we have already seen in Dignaga. It was therefore found necessary to reinterpret the Sutra¹ to make it cover a refutation of the denial by the new school of realism and this was the more easy in that such a refutation was necessarily in part implicit in the refutation of a nihilism which denied reality to thought and external being alike.

The essence of the argument against pure idealism is therefore that it contradicts the nature of our distinction between waking and dream experience. We believe that dream objects have no existence apart from our experience simply because when awake we do not perceive them as objects and this is explicable only on the theory that an external reality does exist. But if there were not a sensible world of experience the dreams themselves could not exist for ultimately dreams are based on a real experience. Moreover only on such a hypothesis as that of an external reality can we explain the distinction between truth and error as seen in hallucination or a mistake and the conviction of such a reality is also forced upon us by the fact that we do not as should be the case if the objects are only our ideas have them continuously and at our pleasure before us as is the case with our own ideas while our perceptions depend on things beyond our power to affect.²

It remains therefore to discover what is the ultimate reality which is thus necessary to explain our experience. Things in the universe are made up of parts which are combined into wholes by the relation of inherence and this conception serves to refute the objections directed against the conception of whole and part on the ground

¹ iv 2 26 30 as taken by Vacaspat. The rendering of iv 2 26 in SBH viii 133 is clearly erroneous *buddhyā* being instr. not abl.

² Cf. Ānandabhaṭṭa on BS ii 2 28. Kumārila CV pp 119 43.

that the whole cannot reside in the parts, since it is greater than any one or more of them apart, nor can the parts reside in the whole since they are less than it, objections founded on a false application of spatial conceptions outside their sphere¹. Now the process of division of a whole can be carried beyond the limits of perception, but not indefinitely there must on pain of a *regressus ad infinitum*, which is inconceivable (*anavasthanupapatti*) be a point at which division stops and there remains a permanent substance which is never destroyed and which cannot be subdivided. To this assumption there is obvious an immediate objection in shape of the existence of the all pervading ether which therefore must compel the atom to have parts. The reply is that the conception of within or without thus implied is inapplicable to an eternal thing which is not a product, the omnipresence of ether is admitted, but it neither repels nor is obstructed and therefore in no wise implies the existence of parts in the atom for it has no form and is intangible. There are the further objections that anything which has magnitude must have form and therefore parts and that the possibility of conjunction with another atom is only possible, if the atom has parts, but these are rejected without detailed refutation on the strength of the overwhelming weight of the argument that there must be an end to divisibility. Nor does the *Taiṣeṣika Sūtra*² add any further argument of weight, it seems to conceive the grounds for accepting atoms to be the fact that there must be something uncaused, and that the existence of non-eternal things implies the existence of the opposed conception of eternal things, which can be found only in the atoms, though

¹ NS. iv 2 4 ff. Cf. Ćaṅkara on BS. ii. 1 26 31

² vii 1 9 10 PBh., p. 28, TB, pp. 73 74 TA., pp. 3 5 TSD p. 10, BP 26

these save in an aggregate cannot be an object of perception. Aggregates differ by reason of the number of the atoms which produce them and thus create magnitude (*malattva*) which is different from minuteness (*anutva*). In the atoms which are infinite in number we can distinguish classes according to their possession of qualities air atoms possessing tangibility, fire that and colour water these and savour and earth these and odour.

The conception thus presented is simple and intelligible it is possibly a development from the earlier position which is represented in the Jain philosophy and which regards matter understood as eternal and undifferentiated as the product of atoms each of which occupies a point in space while they are all equal and not differentiated according to the four elements which are later evolved by a process of differentiation¹. In the Sūtra as in the form of atomism found in Buddhism² the atoms are definitely brought into relation with the four elements by assigning to them specific qualities and possibly also the element of peculiarity (*racasā*) which enables them to remain distinct despite what otherwise must be their entire identity. In the hands of Praçastapada however, there appears already a characteristic development of the theory which renders it far less simple and easy. The magnitude of an aggregate which seemingly was in the view of Kanāda due to the number of the atoms constituting it is held to arise not from these causes alone but also from the magnitude of the constituent parts and their aggregation³.

¹ Above Pt I cl. § 1

² Cf Çankara on BS. li 2. 18 SSS i 4 13 15 SD2 p 13 NY p 246

³ *mahattvapracaya* being supplied in VS vi 1 9 which refers to number of parts only Cf Kir pp 50 3 f 63 8

these terms being read into Kanada's aphorism wholly without warrant, and with a remarkable tendency to ignore the plain fact that the two new factors are on the ultimate analysis, as they are explained, nothing more than the results of the number of parts. On the other hand below the stage at which magnitude is reached, number alone seems to act as a factor, a distinction wholly indefensible in theory, since if the atoms are really the source of all products there can be nothing save number to account for the diverse sizes of things. The impulse to this view may have been given by the aphorism of Kanada which makes the minute the reverse of the thing which has magnitude and which seems to have been interpreted to set an impassable gulf between them and to require that magnitude should be produced from magnitude only. If this were correct it would follow that combination of minute with minute would produce still more minute results but this conclusion would obviously have been contradicted by the fact that the atom was the *minimum divisible* and therefore the rule that number gave increase in size was admitted. Two primary atoms produce the binary (*dvyanu/a*) which still is minute (*anu*) for it is without magnitude in the technical sense three binaries however, produce the triad (*tryananu/a*) which is later asserted to be the mote in the sunbeam and equated with the *tiati*, the phrase used by the *Nyaya Sutra*¹ in expressing the furthest length of division and which there must be deemed to denote a dimension not too small for apprehension.² Possibly³ there may have also contributed to

¹ IV 2 17 The phrase, however is uncertain in sense it may mean only that there is an end to division NBh I c, cf NV pp 233 ff

Jacobi El C 1 202

this result the fact that there was a division in things possessing magnitude between those which were eternal like space and those which were non-eternal the desire to emphasize this contrast also may have led to the setting up of the class of the eternal atom and the perishing binary, but the excrescence on the theory is palpable. The insistence on number, however, gives rise to an effective argument for the impossibility of infinite division, since, if this were possible, it would be necessary to admit the equality of the size of the largest mountain and the smallest heap on the ground of the equality of infinities¹. A further argument, which is probably late in origin deduces that there must be a definite limit to subdivision just as there is a definite limit to extension in the sky².

In *Praçastapada*³ appears also a clear statement of the mode in which the universe comes to rest, and is created again from time to time in an eternal cycle. When a hundred years by the measure of Brahman, are at an end there comes the time for the deliverance of the Brahman then existing. Then to secure rest for living beings wearied by their wanderings the Supreme Lord desires to reabsorb all creation, simultaneously with this desire there arises a cessation of the operations of the unseen tendencies (*adharma*) of all souls that are the causes of their bodies sense organs and gross elements. Then out of the Lord's desire, and from the conjunction of the souls and the material atoms there come about certain disruptions of the atoms constituting the bodies and sense organs. The combination of the atoms is thus destroyed and thus brings about the destruction of all things down to the atoms. There

¹ TSD., § 10, Kir., 1 51 NVT iv 2 17*

² SM on BP 37 cf NV, p 251

³ pp 45 ff, Kir., pp 89 ff

ensues a successive disruption or reabsorption of the ultimate material substances—earth, water, fire and air, one after the other. Thereafter the atoms remain isolated and with them the selves permeated with the potencies of their past virtue and vices. Then again, for the sake of the experience to be gained by living beings, there arises in the mind of the Supreme Lord a desire for creation and there are produced in the atoms of air certain actions or motions due to their conjunction under the influence of the unseen potential tendencies that begin to operate in all souls. These motions bring about the mutual contact of the air atoms and there appears through diad and triad &c finally the great air which exists vibrating in the sky from this springs the great reservoir of water in which appear the great earth and the great fire. By the thought of the Supreme Lord there is produced from earth and fire atoms the cosmic egg in it the Lord produces the worlds and the creator Brahman to whom he assigns the further work of creation. Brahman then endowed with extreme degrees of knowledge, dispassion and power recognizing the ripeness for fruition of the tendencies of living beings creates his mind-born sons the Prajāpatis, the Manus, gods, fathers and seers and from his mouth, arms, thighs and feet the four castes and all other living beings, all having their knowledge and experience in harmony with their previous deeds and then endows them with knowledge, virtue, dispassion, and powers in accord with their respective impressional potencies.

As to the exact mode of the process of destruction a difference exists between the old and the modern schools¹. In the former view the process is from cause

¹ TSD pp. 9-10 TB pp. 71-3

to effect, the union of primary atoms in the binaries is broken, and with it the triads are destroyed and so on. The modern view is intended to meet the criticism made by the Vedānta¹ which insists that the process of destruction must be the reverse of that of creation if the cause is destroyed before the effect, there must be a period when the effect remains in the absence of its parts. It holds therefore that there is in every case one cause the dissolution of the union which is the non-intimate cause of the effect which permits the adoption of the view that the destruction of the universe proceeds from the final effect backwards to the dissolution of the union between the atoms. The conception of cosmic destruction also appears in the later school in two forms in the one the intermediate dissolution (*atantira pralaya*) only tangible products are destroyed in a universal destruction (*mahapralaya*) all these things material and immaterial are dissolved in the atoms and the repetition of creation is established by the authority of scripture. As before the Lord placed all in order.²

The whole theory is exposed to a very elaborate refutation by Čankara in his exposition of the *Brahm Sūtra*³. The possibility of the beginning of motion in the state of dissolution (*pralaya*) is denied it is then impossible to conceive human effort or impact as operative since *ex hypothesi* they do not yet exist. If the unseen principle (*adīsta*) is deemed to be the source it must either inhere in the soul in which case it cannot affect the atoms or in the atoms in which case as an intelligent it cannot set motion on foot. If again the soul is supposed to inhere in the atoms and the unseen

¹ BS : 3 14 with Čankara

² *Mahānā āyana Upaniṣad* v. 7. For a *mahāp alaya* cf. NVT p. 881

³ i 2 13 17 Cf. SS : 110 ff. with commentary v 8 88 NV p. 52.

principle to be combined with it there would be eternal activity, which contradicts the existence of the state of dissolution. Again the unseen principle operates to secure reward and punishment for souls not to produce dissolution which is equally uncaused with the origin of the universe. *How also can two atoms combine?* If in whole then, as there is complete interpenetration there is no increase of bulk and no production is possible, if in part, then the atom has parts just as it must have if soul internal organ and atoms are to combine. Again either the atoms must be ever active or ever inactive, or both or neither. If ever active, dissolution is impossible if ever inactive creation is impossible they cannot be both as that is self contradictory, if neither then activity and inactivity would require operative causes and these causes the unseen principle &c, being in permanent connexion with the atoms, would create permanent activity or if not permanent inactivity. The possibility of connexion (*amalgama*) between the ether or the binary atoms is denied and the argument again adduced that if an atom has form it must have parts. The presence of qualities in the atoms suggests that they are not simple entities but compounds. moreover, the idea that one atom though of the same size as another, has more qualities is untenable yet it is a necessary part of the theory¹ for, if the atoms all had one quality, there would be no variety of qualities if they all had all there would be no single qualities. The whole conception of inherence is proved as we have seen to involve a *regressus ad infinitum* as deadly as the infinite regress objected to by the school while the idea of cause as distinct from the effect is strongly dis

¹ In NS III 1 65 2 it is established by the argument that earth and water are visible and therefore must contain color for if mixture sufficed why is air invisible? See NBH III 1 67

approved. It is of importance to note that in this effective criticism there is no reference to the conception—which Çankara knew—of the activity of the Lord as a source of motion of the atoms. The soul mentioned is that of the individual which in the dissolution is inactive and therefore cannot prove the cause of motion.

The criticism of Çankara is of special value by reason of its date and authoritativeness for it shows that in his time the theory had assumed the form in which it appears in *Prācāstapada*¹ though its theistic tinge was evidently not regarded as a necessary part of it. The history of the development of the system is the more important in that it serves to dispose of the suggestion that in the atoms we are to recognize not material things but real and self subsisting stimuli without any magnitude whatever and non spatial not unlike the qualitative atoms of the Heibartian school.² This theory is supported on the assumption that the atoms being force points two the binary atom constitute a length and three lines thus make up a solid body with magnitude. It is sufficient to observe that the binary atom is not a primitive concept in the school and that thus the whole basis of the theory is removed. Nor are atoms absolutely without magnitude the minute is opposed to magnitude but in the same genus. It is not true that the measures of the atoms being added cannot create any magnitude for in fact three triads consisting of binary atoms makes up a thing with magnitude the atoms are not non spatial³ but devoid of parts and for the same reason not because they are non spatial, they

¹ Kumārila tentatively accepts the theory of ÇV p 207 PSPM, p 92. So the Yoga YS 1 40.

³ NY p 522 Çankara on BS II 2 12 the correct rendering is given in SBE. xxxiv 338.

is not suspected and that luminosity is regarded as a particular variety of colour¹

As we have seen, all the atoms possess the five general qualities of all substances and also the two of priority and posteriority. It has also the qualities of odour which is its special mark, savour, colour, and touch or temperature, gravity, velocity and fluidity. Water has the special quality viscosity, and the other qualities of earth save odour. Fire has the usual seven temperature, colour, fluidity, and velocity, while air has besides the seven only touch and velocity. The qualities are eternal in the atoms but transient in the products. The products again fall into three classes in each case: body, the sense organ, and object which is a loosely used phrase intended to exclude the other two classes, of which the first is plainly an object of sense, though the second while possessing the qualities of its substance possesses them in latent form. The atoms themselves are never objects of normal sense: they are only inferable by the process given above, the apparent inclusion of atoms in that category by Annam Bhatta must be attributed to inadvertence. The qualities also of the atoms can be discerned only in aggregates. There is an obvious difficulty in the question of the relation of the further qualities recognized by the texts with the primitive four attributed to the atoms in the theory of the atoms. Praçastapada and the Sutra stand close to the later view in their enumeration of qualities but while the addition of the seven qualities common to all matter is natural, it is less easy to account for the relation of the special qualities of gravity, fluidity, elasticity, and velocity, the

¹ Ati alpe TS p 118. The reference of *anuprat* heat, to touch is explicable, as touch includes the temperature sense.

² Cf, however NV, p 233, where an early view to this effect appears.

last two of which are classed under the general head of impression (*samskāra*), the solution seems to rest in their being held to be intimately connected with the category of motion.¹

Thus already in the *Vaiśeṣika Sūtra*² gravity is defined as the non inherent cause of the first movement of a falling body. The movement created by gravity produces velocity, which produces a second movement of which the non inherent cause is the first. Gravity is possessed by earth and water and is super sensible, and thus must be inferred. Fluidity³ in its turn is the non inherent cause of the first movement in a thing which becomes fluid and it gives rise to velocity in the same manner as gravity. It is natural (*samsiddhika*) in objects which are liquid at a normal state of temperature but artificial (*namuttika*) in those which require heat to produce liquefaction as in the case of butter among objects derived from earth and of metal among objects connected with fire and it resides therefore in water earth and fire. Unlike gravity fluidity is assumed in the metals the gravity in them being attributed to portions of earth mingled with them. The obvious suggestion that in the same way the fluidity of the metals should be attributed to the water element in them is rebutted by the fact that in that case the fluidity of metals would be natural, not as it is, artificial the

¹ All qualities general and special are equally real, the former depending on peculiarities of their substratum the latter differentiating substances, *NK.* p. 96. The attempt to distinguish primary qualities revealed by touch from other qualities, found in the *Shammasaṅgani* (Waller, *Buddh. Phil.* 1: 107. Rhys Davids, *Buddh. Psych.* p. 43) is philosophically unsound cf. Bouanquet *Logic* II 308.
² Pringle Pattison, *The Idea of God* pp. 115 ff.

³ *VS.* v 1-7 18. PBh. p. 263. SP. §§ 41-99. TB., p. 82. TK. p. 19. TS. § 30. BP. 151. TP. p. 146.

⁴ *VS.* 1: 29, v 2-4. PBh. pp. 264-266. SP. §§ 45-100. TB. p. 82. TK. p. 19. TS. § 31. BP. 151-6. TR., p. 146.

further suggestion that the fluidity of metals can be traced to the fluidity of their earth portions is rejected because the fluidity of metals is indestructible, while that of earth is destructible by intense heat. No trace is to be seen of any recognition of the general similarity of gravity and fluidity, while the restriction of both to the production of the first movement has to be supplemented by assigning a new quality, velocity, which then comes into operation. Velocity¹ is found in the four atomic substances and mind for there can be no motion save in things of limited dimension, and, therefore these five make up the class of corporeal substances (*mūrtadraya*) while together with ether the four atomic substances constitute the elemental substances (*bhūta draya*). With velocity is included under the generic term 'impression' (*saṃskāra*), the quality of elasticity² which is the power possessed by a thing of reverting to its normal condition after tension, it is declared to reside in all the atomic substances. Like velocity it results from motion, and it ends by the effect of the motion which it produces. The term 'impression' applied to these two has obviously been derived from the more primitive use of that word to refer to mental impression, which in the later classification forms the first of the divisions of the class impression, the analogy is obvious, since velocity and elasticity manifest the motion which creates them, and so in a sense survives as an impression in the substratum. The classification is suggestive of the late development of the conception, in fact in the list of qualities attributed to the various

¹ VS I 1 29, v 1 17. PBh, pp 266-267, SP §§ 47, 102, TB p 13, TB, pp. 80-86. TK., pp 19-20, TS, § 75, BP 168-61, TR., p 146.

² Velocity on one view is a separate quality, cf. QDST 63. GSAI xx 49.

substances elasticity is passed tacitly over when velocity is mentioned, and it may represent a still further advance on the primitive idea

Motion itself as a category is analysed into the five kinds of throwing up, throwing down, expansion, contraction and going which is intended to cover any other form of motion¹ Motion resides in substance only, and perishes with it, it is essentially evanescent, it operates by conjunction and disjunction in as much as it is the cause of the separation of an object from the place where it is which destroys the conjunction between the object and the place on which it resides, and leads to the formation of a new conjunction which terminates the motion Thus there can be no generation of motion by motion for, each motion requiring a disjunction after the first disjunction, there must be a conjunction to permit of fresh movement It is for this reason that velocity is necessary to explain the subsequent movements of an arrow shot from a bow but the later doctrine that gravity operates through generating velocity is contrary to the view of Kanāda, who distinguishes between the velocity (*samiskara*) in an arrow discharged, and the gravity which produces its fall when there is no counter acting impulse or velocity Action again is also due either to volition (*prayatna*) which involves contact with the self, or without volition as in the case of throwing a pestle into a mortar which is due to volition while its rebound is the result of conjunction (*samyoga*) which is otherwise described as impulse or impact (*udatana, abhigāta*) The movements of the body in sleep are also without volition The evaporation of water arises from the conjunction of the rays of the sun with air, and the condensation and dissolution of water

¹ VS. i 1 7 see also i 1 11, 14, 20 2 21, 26 29-31 ii 1 21 22 2 25 v 1 an 1 2 an 1 references above ch vi § 2

are due to conjunction with air while fluidity causes the flowing of waters on the surface of the earth and gravity the fall of rain. Other forms of action however exist which cannot be reduced to the operation of volition or conjunction. They comprise in Kanada¹ a variegated list including the initial upward flaring of fire, sideward blowing of wind and actions of atoms and mind, the entry and egress from bodies by the self, the assimilation of food and drink, the conjunction of other products, apparently the production of the embryo, the exhalation of water in trees, the occurrence of earthquakes and similar terrestrial disturbances, the attraction of the magnet, and the motion of the jewel towards the thief. All are accounted for, not by the action of the Lord in the Sutra, but by the unseen principle which represents the fruits of previous deeds. But it is clear that there is no serious effort to consider the question of the mode in which effort of the unseen principle can affect matter so as to produce motion. It is clear that if volition involves the activity of the atomic sized mind and therefore has some vague degree of mediation with the actual atoms, the unseen principle is conceived as operating directly both on the atoms and on mind.

Apart from the qualities which are closely connected with motion and the general qualities of all material objects are the old four qualities to which must be added viscosity² which is apparently a development of fluidity from which it is distinguished on the ground that its peculiar capacity of agglutination (*pindibhava*) is not resident in melted gold that is fluid. It resides in water only, the viscosity of oil, milk &c. is due to

¹ VS v 1 15 2 2 7 13 17 Candrakānta's effort (v 2 2) to explain *adras* as referring to unseen natural forces is unavailing.

² PBI p 266 SP §§ 46 101 TB p 82 TK p 32 TS § 32 BP 157 TR p 147 see VS i 1 2

the presence in them of water though no clear explanation is offered of the reason why oil inflames fire while water extinguishes it for the stock answer that it has more viscosity leaves the question unsolved

Of the traditional four qualities colour¹ is that special quality which is cognized by the eye alone thus excluding substances like light qualities like number which are also perceived by touch, and reflected colour which does not reside directly in the object The classification of colours is not attempted by Praçastapada or Çridhara and is late they are enumerated either as six—white blue yellow red green and brown or with the addition of variegated (*citra*) as seven The addition of this last is due to the doctrine of the difference of the whole from its parts acceptance of this forbids us to admit that a carpet made up of pieces of different colour can be seen as having the colour of its parts which would involve the theory that the parts can be discriminated in the result a view which of course is contrary to the doctrine that the cause perishes in obtaining the effect The carpet must, therefore have no colour which would render it invisible or it must have as the school holds a special variety of colour styled variegated But it is in earth only that colour can appear in all these shades in water it is transparent white alone in fire resplendent white Savour² again is that specific quality perceptible only by the taste organ it is of six kinds—sweet sour saline pungent astringent and bitter earth has all these varieties water is sweet only the dissolution in it of earthy matter accounting for its sour or salt taste

¹ VS vi 118 PBh p 104 SP §§ 7-83 TB., p 3 TK. p 4 TS § 19 BP 100 101 TR. p 14^a

² VS L c. PBh. p 105 TB. p 79 SP §§ 78, 84 TK p 4 TS § 20 BP 101 102 TR., p 14^a

Odour¹ is the specific quality whose characteristic is perceptibility by the organ of smell alone, it is fragrant or the reverse, and resides in earth alone. Touch² (*spaiṣa*) is the specific quality whose characteristic is perceptibility by the skin only, it is cold in water, hot in fire, and temperate in earth and air, and therefore is really the temperature sense rather than touch in the wider connotation or in its specific sense. Another view, however, suggests the addition of a variegated sensation of touch analogous to the variegated colour in sight, and this accords better with the wider view which is not accepted however by the school and in which touch is extended to include such qualities as roughness hardness, smoothness softness³. On yet another view smoothness and hardness are ranked as separate qualities apart from touch, but this is rejected by Annam Bhatta who refers these qualities to degrees of conjunction.

It would appear natural to assume that all these four qualities are eternal in the atoms and non-eternal in products, since they admittedly rest in the atoms. But by a peculiar doctrine⁴ the principle is laid down that in earth even in the atoms the qualities are all non-eternal and are produced by fire, although as regards the atoms this is plainly contradictory. The truth of the theory, so far as it has validity, must rest on the fact that the qualities of earth can be changed by the

¹ VS, 1 c, PBh 1 c, SP, §§ 24-85 TK, 1 c TS, § 21 BP 102-103. The assignment of one quality only to each atom is rejected in VS III 1 64-9.

the presence in them of water though no clear explanation is offered of the reason why oil inflames fire while water extinguishes it for the stock answer that it has more viscosity leaves the question unsolved

Of the traditional four qualities colour¹ is that special quality which is cognized by the eye alone thus excluding substances like light qualities like number which are also perceived by touch and reflected colour which does not reside directly in the object The classification of colours is not attempted by Praçastapada or Çridhara and is late they are enumerated either as six—white blue yellow red green and brown or with the addition of variegated (*cit a*) as seven The addition of this last is due to the doctrine of the difference of the whole from its parts acceptance of this forbids us to admit that a carpet made up of pieces of different colour can be seen as having the colour of its parts which would involve the theory that the parts can be discriminated in the result a view which of course is contrary to the doctrine that the cause perishes in obtaining the effect The carpet must therefore have no colour which would render it invisible or it must have as the school holds a special variety of colour styled variegated But it is in earth only that colour can appear in all these shades in water it is transparent white alone in fire resplendent white Savour² again is that specific quality perceptible only by the taste organ it is of six kinds—sweet sour saline pungent astringent and bitter earth has all these varieties water is sweet only the dissolution in it of earthy matter accounting for its sour or salt taste

Odour¹ is the specific quality whose characteristic is perceptibility by the organ of smell alone it is fragrant or the reverse and resides in earth alone Touch² (*spaṇṣa*) is the specific quality whose characteristic is perceptibility by the skin only it is cold in water hot in fire, and temperate in earth and air and therefore is really the temperature sense rather than touch in the wider connotation or in its specific sense Another view however suggests the addition of a variegated sensation of touch analogous to the variegated colour in sight and this accords better with the wider view which is not accepted however by the school and in which touch is extended to include such qualities as roughness hardness smoothness softness³ On yet another view smoothness and hardness are ranked as separate qualities apart from touch but this is rejected by Annam Bhatta who refers these qualities to degrees of conjunction

It would appear natural to assume that all these four qualities are eternal in the atoms and non eternal in products since they admittedly rest in the atoms But by a peculiar doctrine⁴ the principle is laid down that in earth even in the atoms the qualities are all non eternal and are produced by fire although as regards the atoms this is plainly contradictory The truth of the theory so far as it has validity must rest on the fact that the qualities of earth can be changed by the

application of heat, while in the view of the school water, air, and fire are not so affected when water or air is heated, the result is due to the presence in them of fire elements not to change of their fundamental qualities. But the mode of operation of the heating process is the source of one of the profound differences between the Vaiṣeṣika and the Nyāya in their later developments. When the black pot is burned, the Vaiṣeṣika hold, the pot is destroyed its binaries even being dissolved, the action of fire produces in the individual atoms a red colour and then joins the atoms to form a new compound which ultimately results in the new red pot. If this were not so there would not be the possibility of baking the internal atoms of the pot and the reason why we cannot see the process of dissolution and reassembling is its extreme rapidity the whole occupying a time variously put at five nine ten, or eleven moments. This view of atom baking (*pīḍa prakāśa*) which gives the Vaiṣeṣika school a nickname is clearly incompatible with original colour even in the atoms. The Nyāya view is the sensible one that the pot remains identical as it seems to do, and as is shown by the fact that pots above it do not fall down while the difficulty of the penetration of heat is answered by the common instance of the boiling of water in a pot. This view of pot baking (*pīṭhara prakāśa*) is not inconsistent with original odour in the atoms.

All these four qualities are perceptible only under certain conditions as we have seen and while aggregates of earth water, and fire are directly perceptible an according to the older view of the schools is inferable only though the modern Nyāya holds it to be perceived by touch disagreeing with the view that perception implies manifest colour. The inference rests on the temperature of air as neither hot nor cold which

differentiates it from fire or water, while lack of colour negatives its being earth. Nor is it all pervading like the other four substances, and mind is excluded by its atomic size which would prevent any quality in it being known. Hence we infer a distinct substance, air.¹

Of the products of atoms the sense organs, the tip of the tongue the extremity of the nose, that of the pupil of the eye, and the epidermis, composed of atoms of water earth fire and air respectively, are imperceptible as a condition of their functioning, they all act by contact.² There are bodies³ of earth fire water and air in this world and in those of the deities of fire water and air respectively, an adaptation to popular mythology of the more primitive hylozoism of Jainism which ascribes souls to the minute particles of the elements. Body is the seat of the enjoyment of pleasure and pain by the self, it is a final compound as opposed to a compound which is part of a greater whole and it possesses motion. The Vedānta view of the human body as composed of three or five elements and Prabhakara's preference for four are rejected, bodies in this world are of earth only, either womb born like viviparous and oviparous animals or not so born, including on one view plants⁴ as well as insects and such sages as acquire by their merit bodies without physical birth.⁵

As objects¹ (*viśaya*) other than bodies earth appears as the whole of inorganic nature water as the sea rivers hail &c. Fire products are terrestrial the fuel being earthy in character celestial such as lightning gastric the fire of digestion and mineral. Gold cannot be earth because it remains fluid under extreme heat nor water for its fluidity is artificial nor air because it has colour. It must therefore be fire earth particles accounting for its absence of light and heat. Another division rests on the degree of manifestation of colour and temperature both are fully present in the rays of the sun colour in the moon beams temperature in a red hot potsherd and neither in the lustre of the eye. Aerial products include wind and in the Nyāya view the vital air (*pāṇi*) which the Vaiśeṣika view illogically makes a separate division beside body sense and object. It covers the five *prāṇa*, *apāna* *sarīra* *indriya* *vyāna* noted in the Upaniṣads and in the Vedānta but made of little account by the other schools. One doctrine assigns the five in order to the lungs rectum navel throat and the body generally.

3 Ether and Sound

Ether² has sound as its specific quality and is the inherent cause of sound. The two stand in a unique relation the reference of sound to ether is established

by a process of exhaustion which establishes that sound is not connected with any of the four atomic substances. But as a quality it must inhere in some substance and experience shows it is not the self. It is necessary therefore to infer a substance ether (*ākāśa*) to be the substratum of sound. The Sāṃkhya argument that ether serves as the place of the coming in and going out of products presumably as medium for the movement of sensible things is decisively rejected by the *Vaiśeṣika Sūtra*¹ and the argument for its existence both there and in the Nyāya is based on its relation to sound alone. It is one motionless and omnipresent the Nyāya² expressly arguing that this is not contrary to the existence of atoms as the ether is unrepelled and does not obstruct. It is eternal and possesses the qualities also of number as a unity, and dimension as omnipresent of individuality conjunction and disjunction. These are manifested in the propagation of sound. As the atoms constitute the sense organs for the apprehension of the qualities which are present in atomic products so ether provides the sense organ for the apprehension of sound. The ether enclosed in the cavity of the ear in contact with the ether without affords the organ but it differs from other sense organs in that it possesses its quality sound in normal not in latent form.³

Sound is divided into articulate and inarticulate according to its character and according to its mode of

¹ II 1 20-31. NV 1 1 7. the effort (Cāṇḍakāśita on II 1 20) Clatterji *Hindu Realism*, pp. 165-166) to controvert the clear sense of the Sūtra is needless. production into that produced by conjunction as when a drum is struck by the hand, that produced by disjunction, as when a reed is split and that due to sound. The last variety is requisite to account for the hearing by us of sound. The organ of hearing is the ether in the cavity of the ear, it cannot without loss of identity go out to its object and sound therefore must be propagated from its original source in a series of sounds in a manner likened either to wave motion (*vicitaran gunyaya*)¹ or to the filaments of the Kadamba² which shoot out in all directions from the plant. When a drum is beaten by the hand the inherent cause of the sound produced is the ether, the non-inherent cause is the conjunction of the drum and the ether, the instrumental cause the conjunction of the hand and the drum. When a reed is split the separation of the ether and the parts of the reed is the non-inherent, the separation of the parts the instrumental cause. The sound heard and those intervening between the first and last have the sound as the non-inherent and the wind as the instrumental cause³. On the destruction of sound views differ⁴, Vatsyayana attributes it to contact between sound and an obstructing substance a view which conflicts with the Vaiśeṣika tenet that a quality like sound cannot have another quality like conjunction, Vacaspati, therefore, makes the contact one between ether and an obstacle and Ānandabhaṅga one between air as the instrumental cause and the obstacle. A later doctrine holds that the penultimate and the ultimate sounds mutually destroy each other but this is rejected by

Keçava Miçra on the sound ground that they cannot be contemporaneous at the last and the destruction is therefore attributed to the destruction of the penultimate obviously an unconvincing result

These speculations which are stoutly maintained against the Samkhya view that the organ goes to the sound or the Jain that sound travels bodily to the organ or the Mīmāṃsā which holds that air vibrations affecting the air in the ear manifest the eternal sound are not supported by any experimental evidence a striking proof of the *a priori* character of the speculations of either school They stand however in essential relation to the doctrine of the momentary existence¹ of certain qualities and of motion which as has been seen the schools adapt from Buddhism in the new form of the doctrine the lack of connexion between the moments is removed by the view that each sound comes into being in one moment exists in the next during which period the second sound comes into being and is destroyed in the third moment a conception which renders it possible to conceive of a real series of sounds and applied to the qualities of the self and motion renders continuity effectively possible.

4 *Time and Space*

Time² is defined in the syncretist school as either the cause of our use of temporal expressions or of our knowledge of the ideas of priority and posteriority simultaneity and non simultaneity soon and late &c It is one in number omnipresent in dimension individual in character and possesses the qualities of conjunction and

disjunction The past of an individual is the time characterized by its destruction the future that characterized by its precedent non existence the present is the time whose future existence is destroyed and whose own destruction is about to come

In the *Āyāt Sūtra*¹ the question of the existence of the present time is discussed in answer to the objection that when an object falls we know only the time through which it has fallen and the time through which it still will fall The reply is that without a present there can be no perception and no knowledge, and past and future would have no meaning or existence In the *Vaiśeṣika Sūtra* whence as usual the syncretists borrow their definitions there is further the pregnant doctrine that time is a cause for transient things in which it exists but not for eternal things in which it is not found This is a clear recognition of the fact that the eternal substances do not exist in time while their qualities and motions have only existence there with all the products But the term cause must not be understood in the sense that the Vaiśeṣika adopted the popular view that time was a great cosmic power which caused movement of things² this is wholly contradictory to the view of the Sūtra which never attributes the origin of motion to time as well as to the harmonious tradition of the school Time is a cause only in the loose sense of that term which is affected in the school namely as one of the many conditions which are necessary to the existence of a thing, it belongs to the category of general instrumental cause³ as opposed either to the

specific instrumental cause (*karana*) or the inherent or non inherent causes

The nature of the conjunction which results in the conceptions of priority and posteriority is made clear by the stock example of the school. If we say, 'Here now is a jar' we operate with a conjunction of a special character, that of the sun and the jar, this conjunction is not like that of material objects or their parts, and it is due to some reality which must be inferred and is inferred as time. So again, if we make a youth our starting-point the cognition of priority is produced in the case of an old man whose birth precedes that of the youth by many revolutions of the sun¹. These motions of the sun are the conditions which mark the divisions of time, such as moments, months, and days. It is these conditions which render time apparently manifold instead of one as it really is, and help to create the impression held by some of the Nyaya school that time was, as claimed by the Buddhists, merely a series of moments a view, which as we have seen the Nyaya and Vaicēṣika repudiated as a general principle, but adapted with modifications in their theory of the character of all non eternal existence in the shape of the theory that every quality and action lasts for three moments only. There remains one obvious difficulty in regarding time itself as eternal when its presence in eternal substances is denied. But in both cases the term 'eternal' denotes that which has no cause save itself and really exists and which in the temporal terms which we cannot avoid in use can

¹ The process is a conjunction (*pratyakṣa*) through inference of the motion in the sun which is conjoined with what is conjoined, viz the youth, Kir. p. 110, VSU ii 2 6, NK, p. 34 negates this, and (p. 65) uses bodily conditions as different to give inference of time. The number of conjunctions with parts of space and time is given as the basis of proximity and distance, TB, i 42, PBh. p. 164, NK, i 160.

only be described as eternal unless we frame the concept—though it can have no concrete meaning for us—of that which is not in time at all

Time therefore is regarded as a fundamental reality which is the basis of our time knowledge with which all transient existence is bound up. Thus time is absolutely *a priori* for the school as much as for Kant but as consistent realists they do not ascribe time to the product of mental activity in any form but hold that it imposes its nature on mind

Space¹ Kanada tells us is that which gives rise in respect to two coexisting objects of the recognition that one is distant from the other in more technical language it is the proximate instrumental cause of our use of terms such as or of our conceptions of far and near according as we view the matter from the point of view of our speech or of the thoughts which it embodies. Like air space is a substance which is independent and eternal in the sense in which all substances possess that characteristic like existence it is one and possesses individuality. Like time it is all pervading and possesses conjunction and disjunction and its multiplicity is also due not to its own nature but to the divergence of effects. Our conception of direction as east is derived from the conjunction of the sun as past future and present and similarly with other directions they are given their character by reference to the sun which thus plays with regard to space an analogous part to its action in regard to time. Similarly like time space is inferred on the ground that without some such reality it would be impossible to explain our ideas and language. Space also is a cause but only in the general sense of

¹ VS 1. 10-16 PBh. pp 66, 67 161ff SP §§ 17 80 TA *
p 6 IB p 77 TK p 3 TSD § 16 BP 43 44 K r., pp 1 1 8
TR pp 139 139 Luky p

a part of the conditions necessary for any existence as is time with which it therefore is classed as part of the eight or nine general causes.¹ That space is a reality² which holds things in their place comparable to the power of gravitation regarded as an independent reality and not merely as an attribute of things, is certainly not the conception of any period of the Vaiṣeṣika school.

The distinction between space and time is made clear in the texts which expressly counter the suggestion that priority and posteriority in time and space should be attributed to one and the same cause.³ The condition (*upādhi*) which diversifies time is production or action, that which diversifies space is contact with objects occupying space (*mūrta*). The old man may be near the young man in space but prior in time. Or again the relations of time have a certain degree of constancy (*niyata*) which is denied to those of space. The true explanation of this doctrine can be seen from one of the examples which illustrate it. When one thing is present in time with reference to another thing the latter is also present in time with reference to the former while a mountain which is at one time to the east of us may later be to the west. The idea thus somewhat crudely expressed is clearly that there is a generic distinction between simultaneity in time and side by side relations in space though the example cannot be taken as happily framed or accurate.

From ether space is clearly distinguished in the

¹ Above cit. vii § 4.

² Chatterji, *Hindu Realism*, pp. 57, 61, 167, 168. "The real view of the schools has more affinity with the modern doctrine of space and time as presented in the *Principle of Geometry* by Pappus of Alexandria." *The Idea of God*, pp. 26-364.

³ VSU ii 2 10.

system by the fact that the former has the specific quality of sound while the latter has no specific quality at all, ether produces one effect only sound, space is a general cause, ether has affinities to the atomic substances with which it forms the class of elemental substances (*bhūta dravya*). What, however is the precise ground on which this distinction is set up? The answer is not obvious and it has been suggested¹ that in fact Kanada accepted only one reality variously called, according to the difference of its effects and conditions, ether time and space a view supported by the fact that though he establishes the difference of ether from the atomic substances self and mind he does not explain the difference between ether time, and space, nor differentiate the two from other substances. But this is to ignore the clear meaning of the Sūtra. It is equally unavailing to assert that space is really a force holding things in place in ether which is really space against the driving power of time. The true explanation of the distinction doubtless lies in the inherited differentiation of ether as the substratum of sound and the necessity of expressing by a new term the idea of space² which ether was not well fitted to convey in view of its connexion with the concrete quality sound which brought it into analogy with the atomic substances.

¹ Candrakānta on VS II 2 12. This is the Sāṃkhya view SS II 12.

² In NS II 1 22 *ākāśa* are found with time and ether as general causes. On the perceptibility or inferability of time and space see NM, pp 136-41. Ānandabhaṅga (v 2 25) calls space a non-inherent cause against PBh, p 25.

popular, to judge from the anxiety of the schools to refute it, is met in a variety of ways. Consciousness must exist then in the elements which make up the body, but this is contrary to fact, if each part has consciousness, the result would be confusion, for there could be no agreement among the several consciousnesses to produce a united effect such as is actually seen in our consciousness. Moreover if body had consciousness, why not the water-pot since it is composed of the same elements as body, and should equally well be conscious? If, again, consciousness were a property of matter, it, like colour, would endure, but we find none in a dead body even immediately after death, and even in life cases of unconsciousness occur. How again can a man on this supposition recollect in age what he saw in youth, for his body is completely changed? If it be answered by the fact of causal continuity, it is replied that in that case the son should know the experiences of his father. Without memory too existing in something else than the body, how could a child perform such instinctive acts as that of sucking? Moreover, consciousness is essentially of an object which is not itself, the body is recognized as that which is used by that which belongs to, something not itself. It would be absurd that it should be an object of its own property. Moreover, the whole moral order rests on the difference of the self from the body and its persistence through many different bodies, and the denial of it would be direct impulse to immoral deeds.

The same organs as little are adapted to be the seat of consciousness. Apart from the fact that they are in the ultimate issue matter and therefore, open to the same objections as are raised to the body their essence is to be instruments and an instrument implies an agent who uses it, a fact necessary to explain vision with two

eyes. Again if a sense organ be destroyed we still have the recollection of the thing experienced by its aid. We remember objects also though contact between them and the organs has ceased. We have also co-operation of senses which *ex.hypothesi* would be impossible, as when on seeing a fruit we remember its flavour. Still less is the vital spirit the self for it is no more than the relation of the self to its material environment the body. More generally, consciousness cannot belong to an object, else there would be no memory after consciousness had been destroyed by the destruction of the object. Nor has an object any sense of its own position or of the pleasure it causes, nor does it move with intelligent purpose. Nor could there then be the consciousness which is admittedly experienced. 'I have seen the colour perceived the taste and am feeling the touch', which presumes a power of synthesis impossible in varied objects or in the sense organs.

But consciousness cannot reside in the mind unless that term be used to mean some reality which has cognition by using some instrument other than the senses in which case it amounts to what is in the Nyāya-Vaiśeṣika called the self and the instrument is what is known in that system as the mind. The existence of an intermediary between self and the senses is proved by the fact that if there were direct relation, we should have simultaneous cognition of all kinds and equally simultaneous memory, and further both would always be present which is contrary to fact, and drives us to accept some atomic substance to mediate and secure successive perception and recollection. Further the objects of inner sense our cognitions, feelings, and volitions, must be perceived by the self by means of an instrument which is mind.

Nor, again, can there be accepted the doctrine that

cognition is a momentary self cognizing existence as held by the Buddhists¹, this is contradicted by memory, and the idea that of two ideas related as cause and effect each has the power, though unconnected of conceiving itself as effect or cause as the case may be is purely absurd

Positively, then, we can infer from cognition as a property that it resides in the substance self. Moreover, as from the motion of the chariot we infer the existence of an intelligent agent, so we infer such an agent for the body from its activity and cessation of activity which serve to attain the desirable and avoid the undesirable. Breathing and winking lead us to infer an agent; from the healing of bodily wounds we infer an agent like the master who repairs his house from the action of the mind towards contact with sense organs apprehending desirable objects an agent must also be inferred the same result follows from combined perceptions and recollections the qualities of pleasure and pain, desire and aversion and effort must belong to a subject these qualities cannot belong either to the body or the sense organs, for the following reasons. They are always experienced along with the feeling of the self pleasure means nothing save for a self and so with volition they do not extend to the whole of the body or the organs pleasure or pain may be felt in one part only they do not last as long as their substratum all these states are evanescent, they are not perceptible by external senses like corporal qualities. The existence of the self as a distinct substance is also established by the fact that it is spoken of as I which is quite different from any

¹ NY, I, c contains an interesting refutation of the Buddhist suggestion of *śūnyatā* adducing against that view the Sūtra of the burden bearer Cf Śālikara BS II 2 25 28 29 27 41 NYTP p 53 NYTP I p 395-405

other object, one man's body another can see but not his self. No scriptural proof is therefore essential for the demonstration of the existence of the self.

But there is not one self only which by differentiation becomes many as on the Vedānta theory where ignorance causes the one Brahman to appear as many individuals.¹ This theory is guilty of the paralogism that it ascribes ignorance to that which is pure intelligence, or alternatively it assumes ignorance in the individual souls which come into being only through ignorance. The plurality of selves is proved by the variety of experience and condition: each self has its own series of experiences through which it remains one while it has no knowledge of the experience of any other self. Nor is there any risk of the cessation of the world by the complete emancipation of all the selves for their number is infinite. They possess also individuality as follows from their number, and they are in dimension all pervading as is proved by the upward flaming of fire and the horizontal blowing of air. These are contrary to the property of gravity and can be explained only by the operation of the unseen principle (*adīṣṭa*) inhering in the self the latter being all pervading. Again each self is unproduced and eternal, the argument that being so it can never be released is rejected on the ground that emancipation can be obtained through dispassion arising from recognition of the evils inseparable from the objects of enjoyment in one who recognizes the eternal self. The self also has the properties of conjunction and disjunction since pleasure and other properties arise from the conjunction of the self and the mind and destruction

¹ Candrakānta on VS iii 2 19 21 thus interprets the Sūtra. Contrast SS : 149 64 PSPM pp 80 3 SSS vii 33 39 makes Kun āṛiṣa accept the Vedānta view one of many signs of its late date.

of such experiences must be brought about by disjunction. Accounts later than Praçastapāda add little to his outline: the all pervading character¹ of the soul is also established by the more empiric argument that if atomic it could not feel pleasure or pain simultaneously in different parts of the body: if of intermediate size it must either be larger or smaller than the body in which case it will be unable to occupy the body exactly as it does and should do: if of the same size it will be too small for the body as it grows from birth onwards: not to mention the difficulty of it changing in dimension from birth to birth. The objection to its all pervading character that it should then have all experience is answered by the fact that the self has experience only by contact with mind.

Mind² thus plays a most important part: it is through it that are mediated all the sense impressions from outer sense which else would all be in immediate and eternal conjunction with every self: and it explains the recollection of these impressions: moreover it is the direct means of cognition of the self's own qualities of cognition, feeling and volition: and it explains our memory of them. It is the real ground of individuation: for though each self like each mind is supposed to be distinguished by a peculiarity (*viçesa*) it is impossible to see any distinction other than that based on mind³. The mind must accompany the self in all its peregrinations through bodies as a condition of the identity of the latter: and of its power to exercise in a new body such functions as

other object one man's body another can see but not his self. No scriptural proof is therefore essential for the demonstration of the existence of the self.

But there is not one self only which by differentiation becomes many as on the Vedānta theory where ignorance causes the one Brahman to appear as many individuals.¹ This theory is guilty of the paralogism that it ascribes ignorance to that which is pure intelligence or alternatively it assumes ignorance in the individual souls which come into being only through ignorance. The plurality of selves is proved by the variety of experience and condition each self has its own series of experiences through which it remains one while it has no knowledge of the experience of any other self. Nor is there any risk of the cessation of the world by the complete emancipation of all the selves for their number is infinite. They possess also individuality as follows from their number and they are in dimension all pervading as is proved by the upward flaming of fire and the horizontal blowing of air. These are contrary to the property of gravity and can be explained only by the operation of the unseen principle (*adīsta*) inhering in the self the latter being all pervading. Again each self is unproduced and eternal, the argument that being so it can never be released is rejected on the ground that emancipation can be obtained through dispassion arising from recognition of the evils inseparable from the objects of enjoyment in one who recognizes the eternal self. The self also has the properties of conjunction and disjunction since pleasure and other properties arise from the conjunction of the self and the mind and destruction

¹ Candrakānta on VS i. 2. 19⁰¹ thus interprets the Sūtra. Contrast SS i. 14⁰ Cf. PSPM pp. 80-3. SSS v. i. SS 39 makes h. nārāṇa accept the Vedānta view one of many signs of its late date.

of such experiences must be brought about by disjunction. Accounts later than Praçastapāda add little to his outline, the all pervading character¹ of the soul is also established by the more empiric argument that if atomic it could not feel pleasure or pain simultaneously in different parts of the body if of intermediate size it must either be larger or smaller than the body in which case it will be unable to occupy the body exactly as it does and should do if of the same size it will be too small for the body as it grows from birth onwards not to mention the difficulty of it changing in dimension from birth to birth. The objection to its all pervading character that it should then have all experience is answered by the fact that the self has experience only by contact with mind.

Mind² thus plays a most important part it is through it that are mediated all the sense impressions from outer sense which else would all be in immediate and eternal conjunction with every self and it explains the recollection of these impressions moreover it is the direct means of cognition of the self's own qualities of cognition feeling and volition and it explains our memory of them. It is the real ground of individuation for though each self like each mind is supposed to be distinguished by a peculiarity (*viçea*) it is impossible to see any distinction other than that based on mind. The mind must accompany the self in all its peregrinations through bodies as a condition of the identity of the latter and of its power to exercise in a new body such functions as

sucking. There is but one mind to each self only thus can we explain the fact that there are not many simultaneous cognitions and volitions the apparent simultaneity in such cases is always due to rapidity of motion of the mind just as we see in the whirling of a firebrand a circle of light not a series of separate points. The sight and taste perceptions of treacle are not simultaneous but in extremely rapid succession. A final argument against this primitive suggestion of panpsychism is given to meet the case of the movements of the parts of a snake on its being killed. These are due to the impact of the chopper the rapid motion of its mind or the entry into some part of it of a soul which has been liberated from its body.

In dimension¹ mind must be all pervading according to one Mīmāṃsā view on the ground that it is a substance like time and has no special quality. This must however be denied if it were so it would have all sensations simultaneously and permanently so that cognition would never cease and sleep would be impossible. Moreover mind would then never be in contact with the self since two all pervading substances can never come into contact for if they did they would produce a twice all pervading dimension which is absurd. There would therefore be no experience of cognition feeling and volition which depend on the contact of mind and self. If it is argued that contact between the self and the object would suffice it must be pointed out that in this case the cognition would appear at the place of the object outside the body while if the contact were of the self and the organ² sound would be impossible since the self

¹ TC I 62 ff. *Çaṅkara* makes mind one only as subtle and limited in size but is inconsistent see *Deussen Vedānta* cl xxv so SS III 14 v 69 71. *Prabhākara* thinks it atomic PSPM 1 77 Cf NSM pp 9 60. *Rāḡunaṭīa* (FTN pp 10 15) denies its atomic size.

can never have contact with ether which is also all pervading. Sleep also, it is argued, would be impossible if mind were all pervading, but the reason given why it is possible on the Nyaya view is not convincing, since it involves the arbitrary assumption that mind can in sleep shut itself off from the self in the vein styled *puritat*. If not pervading, the mind must be of intermediate magnitude, which would mean that it consisted of parts and was perishable, or of atomic size it must also possess motion and extreme velocity and the qualities of conjunction and disjunction which are seen in exercise at the leaving or entering a new body, and those of priority and posteriority common to all atomic substances. It is of course individual and as unproduced eternal.

There are obvious difficulties in this strange atomic substance of corporeal (*mustu*) character which is invoked to explain the activity of mind in the modern use of the term. It is a minor point that Gautama¹ did not class it as an organ of sense (*indriya*) and that Vatsyayana is compelled to read its inclusion in this class into the Sutra which in fact classes it only as an object of proof. The argument of Vatsyayana that the mind was accepted as an organ in other systems and not being expressly stated not to be an organ by Gautama must be taken as one is sufficiently refuted by the retort of Dignaga² that the other organs which Vatsyayana mentions should not have been referred to if that principle were valid but the omission in Gautama is of no great importance for the conception of the mind which if an organ, is one of a very peculiar kind. A more

¹ 1, 1, 9

² *Med Log* p 87. According to NBh p 16 mind differs from the organs as being concerned with all objects as without specific quality and immaterial (*abhata*) but NB p 40 accept the first differential only. To call it attention (*Six Systems* p 519) is rather misleading.

serious objection is suggested by the raising of the question whether an instrument is needed to perceive cognitions feelings and volitions since they can be self conscious¹ This is answered by insistence on the fact that the agent the instrument and the object are three essentially different things which cannot be combined in one. The agent is something which is not urged on by something else, the instrument is a thing employed by an agent, the action does not exist when the instrument is already in readiness a view supported by the doctrine of the posteriority of effect to cause We must therefore, have a self, an instrument, and the cognition, feeling or volition which is an action in one sense in one sense an object The Prabhakara view that on the occurrence of a cognition it becomes self luminous like a lamp and the soul becomes manifested as the substratum of and the notion of I in the cognition like the wick of the lamp is rejected on the ground that in the visual cognition This is a pot there is no idea of cognizer or cognition and that when these do arise there is a direct mental cognition of the object as qualified by the cognition and the cognizer, as I know the pot On the strength of this analysis as it seems is based the Nyaya² view that the self is directly apprehended by mind in such a cognition as well as inferable while the strict Vaiśeṣika³ view appears to be that in such a cognition we have no direct cognition of the self but merely ground for an inference though Ācārya⁴ admits the

¹ NK p 96ff NV pp 66 71

² NVT i 1 10 Lakṣ pp 7 8 NSāra p 36 makes it inferable only see NV pp 344 7 in VBh p. 10 it is not perceptible

³ See Candrakānta's exposition of NS i 1 18 TP, p 119 as to inference only so PBh p 70

⁴ NK p 91 perception is inferred p 21 21 so Kūṭarīla CD 1 101 against ISPM 11 7b 80 Cf the Anpavāsa, NM 1 40

possibility of the Vedānta view of the self as knowing itself, and like Cankarī Viçra¹ approximates to the Nyāya view. But both schools are agreed that mind is inferable only on the ground given above.

Thus unhappy conception of a material atomic² substance as an instrument in perception appears thus to have been largely due to the false desire to secure an instrumental cause as well as to the wish to explain the succession of impressions and memory and the imperfect character of both. Mind is thus active in the whole field of our perception including the extraordinary perception which recognizes invariable connexion (*jñāna lakṣaṇa*) and in perfected sages it reaches still higher uses for by contact with their merit it enables them to see all reality even the self directly. It must be understood to be the instrument of thought of the reflection (*pramāṇa*) of inference but this side of its activity is subordinated if not ignored in the schools. On the other hand it serves obviously as a mode of connexion between matter and spirit for it intervenes between the material if imperceptible sense organs and the self and it may best be appreciated when compared with theories of psychophysical interaction which ascribe to the physical side much of the necessary conditions for remembrance.

With the body the self stands in a temporary relation only for as will be seen the body serves only a passing purpose and arises from merit or demerit of the self.³ Unlike the Vedānta and Sāṃkhya the Nyāya and Vaiśeṣika do not picture the self as ever accompanied

¹ VSU in 2 14 16

² The argument that it has no magist de (*Hindu Realism* p. 30) is untenable.

³ VS in 2 64 78. 41 45. NBh. NV in 1 19. VSU, VSV

by a microcosm of the body in the shape of the subtle body,¹ it passes from one frame to another with only the aid of the mind which as atomic is beyond perception and therefore cannot be seen leaving the body on death.

The self again is wholly different from the self of the Vedānta or Kumārila for cognition is merely a quality manifesting itself through mind transiently and feeling and volition which on the Vedānta theory have no place are equally qualities. Of the qualities² of the self cognition has already been examined. pleasure is defined as that which is felt as agreeable by all a definition amended to apply to individual tastes in its relation to the individual. A more fundamental doctrine asserts that it is what is desired for its own sake as in ultimate aim while pain is what is shunned for the same cause. Pain is positive not merely absence of pleasure and can co-exist in the same subject with regard to different objects though it would appear that co-existence must really be swift succession. Pleasure however is always closely accompanied by pain. Desire according to Praçastapada consists in seeking to obtain a thing not yet acquired for one's own sake or that of another it³ may be directed to the supreme good freedom from pain or pleasure or to some object as a means to something else or it may aim at an action which can only be directed towards an object which is capable of attainment by human effort no one desires an action if the end is unattainable by man. Aversion

³ SM or BP 14b.

which includes anger and similar emotions is directed either to pain itself or to an object whence it can spring. As desire and aversion spring from pleasure and pain so they find expression in volition (*prayatna*) effort (*utsaha*) or action (*kr̥ti*) which is the disposition of the self towards carrying out an object. It is of two kinds, on the one hand it is activity (*pravṛtti*) generated by the desire to obtain what is pleasant on the other inactivity (*nivṛtti*) generated by the desire to avoid the painful but in a different sense it is the vital force (*jīvaṇa-yoni*) which is the cause of expiration and inspiration but which unlike volition is not even perceived by mind.¹ The classification as akin to volition is instructive it could not be admitted as physical without introducing an alien element into the self. The cycle is completed by merit and demerit which are produced by actions good or bad and themselves generate pleasure and pain they form together the unseen principle (*adṛṣṭa*) which mould man's body but they are not merely positive and negative demerit is produced not merely by omissions but by positive evil deeds (*papa*).²

The last quality of the self is impression (*samskāra*)³ which is the result of original perceptions of every kind and is the explanation of memory. It is impossible to refer the latter to the original impression as the cause since the impression is transient nor can the absence of the impression produce the result if this were the case as absence is one and the same we should not find the difference which we do observe between the power of

with their disappearance action ends and with it birth and the sorrow consequent thereon. In Kanāda¹ the system is less simple: the obtainment of supreme felicity is declared to be due to merit (*dharmā*) but also to be due to the knowledge of the categories by means of similarity and dissimilarity, that knowledge being produced through special merit. Again² he declares final release (*mokṣa*) to lie in the separation of the self from the body without entering another body, in the absence of merit or demerit which would produce a subsequent embodiment. The process is more fully expressed by Praçastapada³, the desire to obtain the release leads one to acquire knowledge of the categories from a master: this knowledge terminates ignorance: hence love, hate &c., corresponding to the fault of the Nyaya are extinguished: thus no further merit or demerit can arise: the old merit and demerit are extinguished as they have produced their effects: the subject remains free from desire or attachment to the body⁴ and finally his merit ceases having produced the joy of the contemplation of the self: he is done with the body and every result of past activity, and rebirth is impossible. The knowledge of the truth thus is the real cause: the merit only a contributory: but Kanāda's words rather ascribe the origin of knowledge to merit and serve to remind us that the process is one of great complexity: for a man is never free so long as he is not released from the effects of his deeds.

Supreme felicity, however, is variously interpreted.⁵ The Buddhist view finds it in the cessation of all know-

embodied. It is inconceivable that this should be uncaused¹ for we realize the endless chain of cause and effect as in the series of seed and shoot, nor can there be a single cause whether the absolute Brahman as in the Vedānta or the nature of the Sāṃkhya for the effects are various and so must be their causes. Nor can the cause be something visible for men universally offer sacrifice to attain heaven and this must presume an intervening stage of merit so acquired since plainly the sacrifice cannot produce its distant effect without an intermediary. Nor does the desert reside in what is its fruit for that is apportioned to each individual and enjoyed by it. The body of man therefore must be the fruit of previous merit or demerit and there is no ground on which we can conceive a break in the series of embodiments. Confirmation may be found for belief in previous embodiment from the fact of instinct as when a child sucks without teaching or more generally from memory of past births² which seems enjoy and which exist in us as impulses and potentialities lying hid beneath our normal selves and explaining the infinite possibilities of our nature.

Our deeds therefore leave ever their impressions behind and merit and demerit regarded as our actions when they are performed and not in the more general sense in which they include impression³ spring from impressions and give birth to impressions again in an ending series. Man does not necessarily remain in the human state⁴ he may descend into lower bodies he

a denizen of hell or rise to divine rank for the whole pantheon exists in name though the gods are now mere office holders whose posts last no longer than the duration of their merit. The sentient universe then may justly be styled a society of selves in hierarchical order remembering always that there are worlds beyond our knowledge peopled by other selves of higher and lower range creatures of heavens and hells whose reality the school neither can nor will deny. There is a strict régime of justice in this universe for each man reaps what he has sown.

Can we carry the doctrine further and claim that the environment of the selves is built up for the precise purpose of giving to each being its due meed of joy or suffering according to its deeds? There is no doubt as to the orthodox answer for we have seen it given by Praçastapada¹ in his theory of creation. The virtue knowledge dispassion and powers of beings of all kinds are allotted to them by the god Brahman in strict accordance with their impressional potencies but he is not credited with actual cosmic creation of other than living beings for the creation of the worlds is assigned to the Supreme Lord himself. It is impossible then to regard the universe as the creation of the merit of him who appears in it as Brahman and similarly the destruction of the universe is not due to the exhaustion of his merit² but is the work of the Supreme Lord from period to period for the deliverance of the Brahman of the epoch and other wearied living creatures. Did Kanada hold the view that the unseen principle alone produced the periodic creation and destruction of the world? The obscurity of his Sutra leaves the matter open. It may

pp 48, 49

however, be remembered that Çankara¹ attacks the doctrine of atoms on the basis of their receiving their first motion from the unseen principle alone, but this may merely mean that he took advantage of the vagueness of the doctrine of the Vaiçesika. Nor, certainly, can it be deduced from the word Kalpa used of a cosmic age that it is an imagining² of Brahman.

The ceaseless process of creation and destruction carries with it important results. It negatives once and for all the idea of progress, there is nothing new under the sun, and, though sound is not eternal, the teaching of the Veda is eternal, and has been handed down from age to age and from teacher to pupil. The importance of this lies in the fact that the teachers of the Veda as Gautama assures us, were persons of authority, like those who laid down the science of medicine and spells—hardly reassuring society—and Kanāda himself fully accepts the weight of the authoritativeness of the sacred tradition. Nor were the sages mere men of ability; they had a direct intuitive vision of the final truths, they desired to benefit men they had the desire to communicate their valuable knowledge³. Thus all our knowledge is no more than the recognition of truths known long before us, and our conduct in like manner should accommodate itself to the rules which have been declared by the sages of old, the principles regulating castes and rules of life (*varṇāśrama-dharma*).

There can, therefore be no real attempt to place morality on a reasoned basis, merit and demerit arise from observation of the rules laid down by sacred scripture, resting on the divine prompting according to

³ VSU, p. 2 VS, p. 2, v. 2 16.

*Prāṣastapada*¹ and the later school and possibly even in Kanada's view. A considerable part of meritorious actions is made up of ceremonial ritual such as ablutions in the Ganges and the offering of sacrifices and Kanada's² rules of ceremonial have been twisted by his commentators to sanction monstrous conduct, which doubtless never entered his mind³. But the more serious defect in the whole scheme is its completely self regarding character,⁴ whatever value morality may have for others and for society at large its true end is the profit of the individual whose advance in the scale of existence towards final liberation is thus furthered. But, more than this morality in the sense of choice of any kind is imaginary. It is not open to a man to advance himself by seeking to follow the law even for selfish motives. his action is determined irrevocably by his former deeds possibly in long anterior births and his freedom which is the requisite of morality is an idle dream no less unreal because with singular inconsistency the thinkers of India resolutely shut their eyes to this fatal difficulty in the path of the legitimacy for human life of the doctrine of retribution. To enunciate the due reward of actions as explaining man's lot in life asserts a moral principle only to lose it again by denying man's power to choose his path of action.

Why however if the practice of good deeds raises us ever in the scale of existence does not man by attaining the highest rank that of Brahman remain content in it for ever? Here again no obvious explanation can be given, how can he in the perfect wisdom he then has acquire demerit or lose his place? The only reply must be that the sin of some former birth comes to deprive

¹ p. 7² VSU VI 1 12 16³ VI 1 and 2⁴ *H. ut. Real m.*, pp 177-81

him of his high place so that all may realize that in earthly or heavenly pleasure there is no satisfaction. Apparently even Brahman must be on the watch lest others do better their work and win his place.¹

To escape this unending process of troubled striving in which not even a god can find abiding joy it is necessary to turn to the knowledge of the self, as enjoined in the scriptures which demand meditation and reflection on the self. It is egoism (*ahankāra*) which leads us to a false estimate of the things of life, we see the whole only in its beauty, and are moved to eager desire and action² or we see its defects and shrink from it but if we realized the parts which make up every whole we would see that they are compounds all of the same elements which arouse no emotion in us. We would realize also the absolute sameness of the selves and their independence of the bodies in which at present they continue to transmigrate and our empirical existence would come to an end with all our woe.

To attain this end we have the aid of the seers of old whose lore is handed down in the schools of the day. A necessary propaedeutic as Kanada clearly lays down is the performance of meritorious conduct. Then only are we ripe to take up the first part of the course of instruction bearing (*śrauta*) the enunciation of truths from teachers. From it we proceed to the examination in the light of reasons for and against of the truths thus accepted on authority. It is at this stage that the philosophical expositions of Gautama and Kanada and the systems based on them must be subjected to

¹ *Nh* p. 6

² An absolute first creation is assumed to be absurd cf *NBh* i 1 19 in 1 27 *PBh*, p. 49 for a proof see *BS* ii 1 34 6 with *Śākhā*

³ *NS* iv 2 2. Cf *NBh* iv -- 1

examination. In an interesting passage Vatsyayana¹ asserts the characteristic of the Nyaya philosophy which gives it a claim to be more than a mere doctrine of the self like the Upanisads. It uses investigation (*anviksa*) to examine all things which are known to us whether based on the senses or on the sacred tradition. It must not be thought that it is meant that philosophy can override that tradition which Gautama and Kanada constantly refer to. Philosophy is rather the reasoned exposition and demonstration of that which is known already from a source of eternal truth the Veda. If Kanada and his school deny a separate place to verbal testimony among the means of proof, that is only because it can be brought under inference since we believe testimony either because of the worth of him who bears it or the truth of the facts it reveals.

But it is not enough thus to know the truths they must be realized in experience,² which is produced by concentration (*yoga samadhi*) of our mind on the object of knowledge.³ Such an experience must have been prepared for by merit of an earlier existence or period of our life, and it may be helped by restraint (*yama*) and observance of rules calculated to secure a due state of body and mind and the choice of a forest, cave, or sand bank for a place of meditation. But it presupposes the mental preparation ensured by the study of the philosophy of the school and discussion with preceptors and others bent on truth. The result of this mental effort is the attainment of the actual perception by the adept (*yogin*) of the self by a special conjunction of the self and the mind in the self.⁴ He has also perception

of the other substances—the atoms space time the ether and mind—and he perceives their motion and their qualities as well as the qualities of the soul by their inherence in their substrates. He will also have the power to withdraw the mind from the body and thus separate himself from his mortal frame like a snake from its worn out skin. All his former lives will come to him and he will realize how his self passed from body to body on death and rebirth. He will realize also it is later made clear the merit and demerit accumulated by him through former deeds and he will be able to construct bodies suitable for the embodiment of their experience. In this way by actually experiencing the merit and demerit he will exhaust it and reach the stage of liberation in which there will be complete cessation of pain as a cessation of activity and rebirth. There are however two stages of the vision of seers one appertaining to those who are complete masters of concentration with whom vision is ever present and the other which belongs to the less perfect visionary who needs to attain such insight the application of a definite act of concentration.¹

And here we must leave the mystic for the bounds of philosophy are clearly outpassed. It is a strange and incomprehensible vision which the seer has before him in which the eternal structure of the world lies before him intermingled with the memory of the infinite detail of endless lives.* Its objective value we may safely

¹ So VS, ix 1-13 may be taken. Cf FPI p. 18. NK p. 198. SDBT 67 with VSU and USV. In VSara pp. 3, 4 82-6, makes a division of Yogins according to having *samādhi* or not.

² According to Chatterji, *Hindu Religion* p. 170 the Yogin has intuition of general truths or ideas, as existing independently from concrete things. But this is not in the text, and is only a "restatement" in recent works like USV ix 1-14. VSara 1c gives to Yogins in the

deny, since other mystics of India and distant lands have presented us with a very different picture of the beatific visions attained by them when the mind has been divested of all its normal trappings in the hope that thus there will enter it truths which are denied to the strivings of intellect. And one further criticism is inevitable the problem how man is to counteract the effects of former deeds which must bear fruit proves intractable to a reasonable solution. We are compelled in the normal theory of retribution to admit that no one life represents the whole of the potential merit or demerit of man were it not so there would not be a long round of varied lives in animals man gods and denizens of hell but there would be definite progress in one way or another. It is impossible then to admit that the one life in which enlightenment is attained can extinguish all the prior merit and demerit and it is necessary to conjure up new lives of a magic sort in which the seer may experience in his proper self the final emancipation the merit and demerit of his past. Thus room is made for the introduction at a moment which should be sublime of an element of vulgar transmaturgy which is in no wise excused by the fact that it can claim the august authority of the Upanisads and of the Vedānta itself.

When then life finally ceases what is left? The schools reply The utter annihilation of pain;¹ and the answer is true, but at the cost of the complete annihilation of all that we were or sought to be. What is the condition of a self which has ceased to be in relation with the transient and therefore can have neither consciousness feeling or volition is a problem which the

state of *samādhi* an indeterminate perception of the whole expanse of reality at one glance Cf NM pp. 162-8

¹ NS I 1 22 NK p 6, TB p 91; *Padārthanirṇāṇa* also pp 42-51

schools make no effort to solve nor is their wisdom in silence doubtful¹

The final severance of the self and the body is the aim also of the Sāṃkhya and Yoga schools, but there is a distinction in the conception which either school has regarding the severance of the self and the body. If, the Nyāya² argues, the body is connected with soul merely in order to enable the latter to realize its difference from matter, and then to obtain permanent separation from it this end cannot be deemed to be accomplished for the same relation might easily occur even after the release of the soul mere knowledge of the distinction is not enough to produce final severance there must be a complete exhaustion of desire with which the possibility of revival of the connexion between self and body for ever disappears. Nor can the Nyāya³ permit any breach through the intervention of God, in the series of fruition of mortal action. It we seem not to see the fruition of man's deeds yet we cannot invoke the causality of God, for without action no fruition is ever possible and we must assume that ultimately all fruition results from man's action alone⁴

¹ *Nāṭya*, pp. 30-41 pronounces in favour of total happiness in release but see *NB* pp. 30-4 *NV* pp. 88-91 *PSM* p. 81. The Nyāya of *SS* vi. 41-3 protests against the *Vaiśeṣika* ideal (v. 36) of an existence without happiness like a stone and demands constant pleasure without objects of sense perception. Cf. *NVT* pp. 6-7. *NVTP* pp. 21-2 where the reference is to *SS* vi. 41 rather than as taken in the ed. Cf. *NM*, p. 507 ff.

² *NS* iii. 2. 73-8. The Sāṃkhya retorts by rejecting the Nyāya view *SS* v. 74, 75.

³ *NS* ii. 1. 13-21 the rendering in *SBH* iii. 11. is quite impossible in asserting God's intervention. Cf. p. 266, n. 1.

⁴ The meanest words merit in *IBh* pp. 22-23 are commonplace of Indian asceticism and need not be referred with Fallacy (p. 32) to *YS* ii. 30 or the *Bh* iii. 1st *śūtra*.

CHAPTER X

THE EXISTENCE AND NATURE OF GOD

1 *The Theism of the System*

THE Nyaya-Vaiśeṣika in the syncretist texts¹ is frankly theistic—those which follow the tradition of the Vaiśeṣika and adopt its order of exposition, find place for the conception of God under the category of substance as one great subdivision of the self with which on their theory God has eight qualities in common the five common to all beings—number as one—dimension—space—all pervading—individuality, conjunction and disjunction which are necessary in creation and cognition, desire and action. But they admit that his cognition differs essentially from that of man in that it is eternal universal and absolute while that of man is transient particular and relative. On the other hand the Nyaya tradition as seen in the *Tarkabhāṣa* not being confined within the strict system of categories of the Vaiśeṣika is free to treat God as a being of quite exceptional character not to be regarded as in any sense on a par with the human soul.

It is of interest also that there is clear evidence in the fourteenth century of the very definitely religious tinge of the votaries who professed one or other of the systems. Rājāṣekhara, in his *Siddharṣanaśimuccaya*² expressly applies the term *Yogi* to the Nyaya and makes the followers of the Vaiśeṣika also in their religious aspect

¹ *TK*, p. 4. *TS*, § 17.

² *vy* 94. 113. 1st 2–31. *Sūtra* 10. r. pp. 127 ff.

similar to those of the Nyaya, the only difference between the two on his view is that the adherents of the Nyaya are called Çaivas, those of the Vaiçesika Paçupatas. He described the ascetic practices of these sectarians which equate them to the ordinary votaries of Çiva. His evidence is supported by that of Gunaratna in his commentary on Haribhadra's *Saddarśanasamuccaya*¹ of slightly later date though it is possible that he draws from the same source as Rajaçekhara. He gives four main divisions of the Nyaya Vaiçesika sectaries the Çaivas Paçupatis Mīhāvratadhāras and Kālmukhas with various subdivisions including the Bharatās who are mentioned also by Rajaçekhara and whose characteristic trait was the fact that they accepted a man of any caste provided he was a devotee of Çiva. Jinādatta in his *Vaiçesikānandī*² about the middle of the thirteenth century states that the texts of the Nyaya and Vaiçesika were used in the Çaiva system and that these systems had Çiva for their deity. It is impossible to discredit the value of this testimony which is the more valuable in that the normal source whence to seek the inspiration of the Çaiva systems is the Sāṃkhya which has admittedly close relations with the development of Çaiva philosophy. The antiquity of the connexion is attested by the tradition which is preserved by Praçastapada³ that it was Çiva in the shape of an owl who revealed to Kanada the Vaiçesika system. Praçastapada⁴ also in his exposition of creation uses as the name of the creator Mahāçvara, a choice in which we can hardly fail to see a deliberate preference for the view that the true God is Çiva. Of Uddyotakara we have the express evidence of the *Nyayavārttika* that he

¹ pp. 43 ff

² viii 25-30. Cf. *SS* vi 12 19

³ p. 37

⁴ p. 48, 49 at p. 7 *Vara* is used.

was a Paçupata, and it is interesting to note that in his *Nyāyivarttika*¹ he adopts theism and quotes a verse which is given by Madhva in the *Sarvadārṣaṇasamgraha*² as one in which the supporters of the Çaiva system maintain the existence of God. Theism in the Nyaya is shown to be recognized by Vatsyayana³ not so much because he declares that the self sees all feels all knows all and perceives all a description which would hardly be true if he did not in the term self include God as the self *par excellence* as because of his defence of the activity of God in the fruition of deeds. An express proof of the connexion of Nyaya with Çaivism is seen in Bhasarvajña's *Nyayasara*⁴ which may date before Udayana and in which it is expressly said that final release is produced in the Çaiva system, and stress is laid on the necessity of the practice of the recognized kinds of mental concentration which at last will yield the direct vision of Maheçvara. Similarly Udayana⁵ who is the classical exponent of the theism of the two systems treats the God whom he demonstrates as equivalent to Çiva.

Can we therefore assert that the silence of Kanada and Gautama unless in the latter case we believe that the self for him included God means that the authors of the *Nyaya* and *Vaiçeṣika Sūtras* were not believers in God? It has been contended not only that this is the case⁶ but that the atheism of the schools was borrowed from the Sankhya but for this theory there is no positive evidence forthcoming and it must be judged merely on the probabilities of the case. On the whole there is so little sign of Sankhya affinity that it would be as easy to attribute the atheism of the systems to the

¹ iv 1 21² p 6³ NBh i 1 9 iv 1 21⁴ p 23⁵ Kus ii 4⁶ Garbe *Sāṃkhya* p. 119 *Phil. of Anc. Ind* a p 23. He ignores the early evidence entirely.

influence of the Purva Mimamsa whose importance as discrediting the idea of God must not be underestimated. A different explanation is suggested by the later and modern Indian doctrine¹ that the systems are not to be deemed as fundamentally opposed but as aspects or standpoints whence so much of truth is revealed as may be adapted to the minds which are to receive it. In this sense the doctrine is pressed too far: it is the result of a philosophic mind reviewing from the standpoint of wide knowledge of the systems their points of community and seeking to find a comprehensive formula to fuse them in one. This can be accomplished by treating the Sāṃkhya as a further advance in analysis on the Nyaya-Vaiśeṣika and then finding in the Vedānta the final truth. But to convert a theory of reconciliation into sober history is unwise and unconvincing.

On the other hand the actual condition of the two Sūtras provides ground for the belief that they cannot be deemed to cover the whole field. Neither gives the impression of a well thought-out and ordered whole. Praśastapāda, indeed had to restate the Vaiśeṣika before it could be deemed a systematic treatise in any sense and the Nyaya is so predominantly dialectical in interest that its excursions into metaphysics have an air of divagation from the work in hand which forbids us to assume that silence on any topic means its exclusion. One thing at least is certain: if we assume that Kanada² or Gautama intended the theory to stand by itself without the introduction of a creator we fall into the difficulties pressed relentlessly by Čāṅkara who assumes

¹ Max Müller *Six Systems* p. xvii. Clatterji *Hindu Theism* pp. 5-17. (Sāṃkhya, Jñāna, etc.) pp. 6-8. Müller's denial (pp. 276-81) of Jainism's atheism is an error. PSI M., p. 82-9.

² The common references to God in VS. i. 1. 3 (= x. 2. 3) vi. 1. 1-4. ii. 1. 18, 19 as author of the Veda, of names, &c. above ch. v. § 2. Baldegon (p. 304) favours, without proving, atheism.

based on the regular alternation of day and night, the impossibility of the birth of a Brahman at the outset of creation without one of that caste to be his father the impossibility of the inauguration of language or traditional arts, and the impossibility of cessation in the process of the ripening of the fruits of action. Merit he replies, may produce miraculous birth. God may teach language and the arts assuming both the preceptors and the pupils forms¹ in deep sleep the fruition of acts is suspended and still more so at the destruction of the world, a view which removes the difficulty of the process of time. Positively too the decay of customs morals and learning show how the Veda gradually dies out to be revived at a new creation.

Thirdly, it is shown that no means of proof yields results opposed to the reality of God. He is not perceived but *ex hypothesi* he is not perceptible. He is inferred and inference is trustworthy its refutation always rests on inference which shows that it cannot inherently be invalid. Comparison yields only knowledge of the significance of words and tells nothing of existence and thus cannot negate God. Verbal testimony declares his being when it seems to negate it it merely denies him attributes. The argument from presumption

If God were omniscient would he not cause us to act without laying down injunctions? whence the uselessness of the Veda and the non existence therefore of its author are deduced is invalid for we must have directions for our actions, and in any case presumption and non apprehension are not valid means of proof.

Fourthly the Mīmāṃsā argument that even if God exists, he cannot be the source of right knowledge for us since his own knowledge lacks the essential characteristic of true knowledge, the apprehension of objects

hitherto unknown is met by a denial of this definition of knowledge, right knowledge is an independent impression in accord with reality, and its truth does not depend on novelty

Finally, with some repetition direct proofs for the existence of God are adduced. These are the nature of effects the combinations of atoms in creation the support and destruction of the world the existence of traditional arts, the authoritativeness of the Veda which produces right knowledge in us and presupposes a being who imparted this virtue its existence which implies a maker its consisting of sentences like books made by man and last the peculiar nature of number duality and subsequent numbers as we have seen have no absolute existence but depend on the relating power of the intellect and thus at creation it must have been God whose concept of duality produced the binary atom which ultimately starts the formation of the world. The first five of these arguments however may be interpreted of scripture as referring to the purport of words which is God their explanation due to God their preservation through him their significance in words denoting God and the affix of the imperative which alludes in commands of scripture to the expression of the will of God

Leaving aside these needless exercises of ingenuity the argument for the existence of God rests on the fact that creation needs an agent. The argument runs 'Every effect must have an intelligent agent the universe is an effect therefore it must have an intelligent agent. This is the doctrine expressed by Quidhara¹ in commenting on Praçastapada's account of creation in

¹ NK., pp. 54-7 cf. SDS cl xv NS ra pp 3a 3c 2a4 ff SSS vi 6 ff TC i 2 1 ff NBh NV NYT on iv 1 a1 SDS 13 NM pp 190 ff GSAI xix, 11 15 TR pp 171 172 Kir pp 97 101.

which the activity of a creator is assumed, but not expressly proved, and in the course of it he deals with some of the obvious objections to the theory. It is objected that God, having no unsatisfied desires, cannot possess the necessary impetus to action to which the reply is that he acts for the benefit of other selves, which is a sufficient if not a selfish motive. The further objection that in that case he should create pleasure alone in the world is met by the retort that in his action God is moved by the necessity of conforming to the tendencies of beings conditioned by their former actions and that pain is no unmixed evil since it leads beings to realize the vanity of mundane existence. Nor is it a disproof of his independent divinity that in creation he should award beings lots according to their deserts, which is the due mode for a master to treat his servants. The minor objection to creation that the knowledge of words would be impossible is incidentally refuted by the quaint argument that it is the pain of birth which causes ordinary beings to lose their memory while the mindborn sons of Brahman suffer no such pain and from their past memory are able to revise at once the conventions of language.

More serious is the argument that the syllogism adduced does not prove the result. A jar is certainly produced by the potter but in addition to the knowledge of his material his desire and action he must have a body in order to bring about the result and therefore God must have a body, which is contrary to our observation. The answer to this is that mere possession of a body cannot be the real point in question, for else a man while in sleep would be an agent, it must rather be the character of being an operator of instruments sufficient to bring about a result and an unembodied being can possess this power as in the case of the soul

which moves by its volition the body. True the body exists and belongs to the soul, but it is the soul which impels, and God has the atoms to impel in lieu of the body which the soul has as its object. Nor is there any real difficulty in understanding how he can possess intelligence, desire and volition as eternal, whence his power of creation may be derived. On the other hand, it is urged that the souls and the atoms together can account for the whole of creation. To this Çrîdhara replies that this cannot be, since until creation has operated, the souls are not united with sense organs through which alone they can possess cognitions. If it is replied that the soul has an inherent intelligence which is all-pervading, the answer is that this is contrary to experience which shows that the soul on birth in a body finds all things new and that therefore it does not continuously function so that we are compelled to resort to illegitimate hypotheses if we depart from the sound view that a soul needs sense organs to be conscious. It follows therefore, that creation requires the operation of an active intelligence which is that of God. The unity of God follows from the fact that there is no ground to accept a multiplicity of equally omniscient beings to perform the work of creation and further such a multiplicity would by interference rather hinder than further the result.

The qualities ¹ of God follow from his complete knowledge, he cannot be ignorant, nor have attachment or aversion from objects, hence he cannot have any activity, or acquire merit or demerit, or then consequences pleasure and pain. Nor can he have impressions since all his knowledge is immediate and eternal. This enumeration however leaves one obvious difficulty,

¹ NK p 58, SSS vi 14. He is all pervading and has indivisibility conjunction and disjunction.

that the universe is a product can be assailed, we can adduce only individual cases of products, to assert that the whole of which they are parts must be a product is a paralogism. Nor indeed can we prove that every thing is produced, even among ordinary things for our sphere of knowledge is severely limited. Again the atoms, ether, time and space souls and minds are admittedly eternal and uncreated, therefore the argument that the universe must have a creator is inconsistent and illogical. Nor indeed is it legitimate to call the world a product and argue thence to the cause unless the cause can be proved independently. Moreover, God as possessing will must have desire and pleasure and pain and so is no more than glorified man. In truth it is plain that a creator who is only powerful to create and destroy at intervals in strict accordance with merit and demerit and who exercises no influence at all on the fates of mankind is a strange anomaly.

But, whatever the difficulties in the theory it is plain that it was impossible for the schools to remain without it for they could not otherwise conceive the beginning and end of the world in which they believed as an established traditional doctrine and which it must be remembered was especially connected with *Qua* as the destroyer and the Brahmanical deity *par excellence*. Moreover even had they been willing to ignore this dogma they would have been in no better case, for, on their theory of eternal independent substances there is no ground of connexion between self and body, and an intermediary must be found. The Jain view of self moving atoms is more simple in one sense but it is less philosophical reflecting as it does nothing but a primitive animism. The intervention of God as the first origin of motion was thus natural and it obviously adapted itself well to the traditional cosmogony. But,

even so one difficulty remains obvious, how comes it that all the souls lose their activity at the time of dissolution and regain it at the coming into being of the world? Such a preconceived harmony is inexplicable unless a direct intervention of God is imagined, consisting at least in postponing while not diverting the fruition of action—as in deep sleep but curiously enough Çrīdhara shrinks from drawing this obvious and indeed necessary conclusion. While the Vedānta suppresses the reality of the individual in the absolute and the Sāṃkhya insists on the existence only of mutually unconnected individuals in both cases denying any possibility of system in the universe the Nyāya Vaiśeṣika produces but in a mechanical and external form a certain measure of unity. All three however agree in denying any real value to human experience and endeavour and stand in fundamental contrast with the tendency of recent thought whether theistic¹ or atheistic² to view the process of the universe as real and to insist on the fact not of the independence and self sufficiency of the individual but of the necessity of the communion of selves as the basis of their reality.³

On a lower plane of popular thought stands the conception of the *Nyāyasūtra*⁴ reflected in the *Sarvasiddhantasamgraha*⁵ in which Çiva appears as the omniscient creator by whose grace the reward of devotion,

¹ e.g. G. H. Howison *The Limits of Evolution* pp. 32, ff. Hastings Rashdall, *Theory of Good and Evil*, ii. 237 ff.

² e.g. J. E. McTaggart, *Studies in Hegelian Cosmology* pp. 3rd ff.

³ Contrast Pringle Pattison, *Hegelianism and Personality* pp. 22, ff., and *The Idea of God*, pp. 3-5 ff. In H. Bouanquet's *Value and Destiny of the Individual* as in F. H. Bradley's *Appearance and Reality* the individual is overwhelmed in the absolute as in Çāṅkara.

⁴ pp. 34, 40, 41.

⁵ v. 10-31, 5 (Vaiśeṣika), vi. 10-21, 40-4 (Nyāya).

the worshipper obtains release in the form of eternal pleasurable consciousness. This in the Nyāya and Vaiśeṣika we find, as in the Vedānta of Rāmānuja, an effort to adapt philosophy to meet the cravings of popular theology.

tain, 228

SANSKRIT INDEX

- Akṣipti*, non apprehension, 48.
Anu, as characteristic of mind, 214
Anu, *Paramanu*, atom, 16, 17, 182, 183, 192, 208-23, 226, 227
Anukta, 188
Atyapatti, in definition, 153
Atyanubhava, absolute non existence, 200 n 2
Adṛṣṭa, unseen potency 214, 216, 223, 224, 242, 249, 254, 255, 266.
Adṛṣṭalaksana samanya, 91
Adharma, demerit, 185, 186 192, 251, 253.
Adhika, redundancy (in statement of syllogism), 178.
Adhikarana-siddhānta, 176.
Anadhyarastā, fallacy, 139 150
Anapadeṣa, 133.
Anatāsṭha, *regressus ad infinitum*, 60, 156
Anuṣṭā, moment of destruction, 207 n 2
Anuracanīya-khyāti, 52
Anuṣṭāpakaśāstrī, fallacy 146 n 2
Anuṣṭā, permission, 160
Anupalabdhī, non-apprehension as a *Pramāṇa*, 57 78 79, 102
Anupastambhin fallacy 140, 146
Anumana, inference, 85-122
Anumiti inferential judgement 54, 56
Anumeya, meaning of, 133.
Anuvāda, reiteration, 160 n 1
Anuṣṭārasya, reference to self, 43 51 n 1, 73, 246
Anukāntika, fallacy, 21, 131, 134 144
Anyakāśāsiddhī, class of fallacies 146 n 2
Anyāka khyāti, misapprehension, 48
Anjathī-siddhā, in causation, 199
Anyathāsiddhā, fallacy, 146 n 2
Anyonabhāva mutual non-existence 183, 188, 205 n 2
Anyonyācāraya, dilemma, 65
Anṛaya, 92, 97
Anṛaya-ryatirekīya positive and negative concomitance, 120
Anṛīka characteristic of *Nyāya*, 258.
Apadeṣa second member of syllogism, 96 133
Aparāṇa, posteriority, 181, 188 n 4, 191 220, 282-7
Apasiddhānta, 156.
Āpāna, a vital air, 229
Āpura mysterious potency, supervening on sacrifice, 250, 253.
Āpekṣa-buddhi, relating consciousness 187, 191
Āpoḥa, negative character of assertion, 106
Āpokasiddhī, by *Ratnakīrti*, 29, 106 n 1
Āpratibha, lack of ingenuity, 155
Āprama false knowledge, 45
Āprasiddhā fallacy, 133, 139
Ābhāva, as means of proof, 57, and see *Anupalabdhī*, as non-existence, 180, 188 204 7
Ābhigṛāha, impact 223.
Ābhidharmakośyākhya, 207, n 2.
Ābhautika of mind, 245 n 2
Ābhyupagāma-siddhānta, 176.
Ābhānta, correct, 71, 101
Āyathartha, false (knowledge), 45
Āyaktavāha 83 n 2, 259
Āyāta siddhā, 197
Ārīha, object, 180
Ārīharuparā, characteristic of inference, 123.
Ārīharāda, 165

- Arikaṣāstra*, 12

PRINTED IN ENGLAND
AT THE OXFORD UNIVERSITY PRESS

BY VINCENT A. SMITH, C.I.E.

April 1920

THE OXFORD HISTORY OF INDIA from the Earliest Times to the end of 1911. 1919 Crown 8vo (7½ × 5), pp xxiv + 816, with one hundred and eighty two illustrations and twenty four maps and plans. 12s 6d net. Also issued for India, Parts I-III separately.

'Dr Vincent Smith has in this volume (a marvel of skilful selection and concision) completely superseded all existing manuals of Indian history. To tell so long and varied a tale in some seven hundred and eighty pages, to be at once brief, accurate, informing and entertaining, is to perform a feat which calls for respectful admiration. Dr Vincent Smith has achieved it with an ease and success due to long practice and a life-long enthusiasm for his subject. We have here incomparably the best summary history of India yet written. — *Spectator*

'Dr Vincent Smith's study of first hand authorities has been exhaustive—he has made his studies on the spot, and he writes with eminent fairness and candour. He has given us an admirable book of reference. We have described Dr Vincent Smith's work as a chronicle, but it must not be supposed that it is a mere collection of names and dates. On the contrary, one is struck by the great wealth of picturesque and interesting detail which the author has managed to pack into his small space. The book is abundantly illustrated.' — *Times Literary Supplement*

THE EARLY HISTORY OF INDIA from 600 B.C. to the Muhammadan Conquest, including the invasion of Alexander the Great. Third edition, revised and enlarged, 1914. 8vo, pp xii + 512, with separate plates, and maps and plans. 14s net.

'The author has patiently sifted a vast mass of evidence and condensed it into a connected summary of moderate dimensions. His style is lucid and elegant. His intimate acquaintance with modern India gives a special zest and an authoritative value to his statements and conclusions. — *Journal of the Royal Asiatic Society*

'A work which will form a foundation for future historians of India to build upon, and at the same time assist students to gain a better and a more connected record of early Indian history. — *Journal of the Royal Colonial Institute*

AKBAR, the Great Mogul, 1542-1605 Second edition, 1920. 8vo, pp xvi + 504, with fourteen illustrations in half tone, a frontispiece in colour, and ten maps. 16s net.

'Mr Vincent Smith has ransacked all the surviving authorities (including for the first time in English, the Jesuit Fathers) and has put the materials thus compiled into a very attractive and absorbing literary shape. His book deserves more than one attentive reading, and will, no doubt, long be the standard life of the great Mogul. — *Spectator*

ASOKA, the Buddhist Emperor of India. Second edition, revised and enlarged. 1909. Crown 8vo, pp 252, with two illustrations in half tone and a map. 4s net. (Rulers of India Series.)

Contains a readable English version of all edicts and other inscriptions of Asoka, with so much of introduction and commentary needful to make them intelligible to the lay reader. The author has very successfully carried out his purpose. — *Times of India*

THE STUDENT'S HISTORY OF INDIA. Eighth edition, revised and enlarged, 1918. With appendixes, including King George's Message to the Princes and Peoples of India. 1914. Crown 8vo, pp 364, with forty-eight illustrations and maps. 3s net.

'The repeated and continuous demand for new editions of the book bespeaks its value and popularity. Without going into meticulous detail it gives a concise and careful outline of the country and its peoples throughout their long and varied history, and surveys the main movements, causes, courses and effects, in a fair, critical and most informative manner. — *Irish Independent*
